

PURPOSE OF THE STUDY

Congestive heart failure due to mitral valve disease is the most common cardiovascular disease in dogs. If left untreated, the disease can have secondary effects on other organs. We are currently accepting dogs in a clinical trial to investigate a potential new way of managing congestive heart failure due to mitral valve disease.

This study will evaluate the safety and effectiveness of the management of pulmonary edema for your dogs congestive heart failure caused by myxomatous mitral valve disease.

WHAT WILL HAPPEN IN THE STUDY

There will be:

- Physical examinations
- Lab work
- Echocardiogram
- Radiographs
- Study treatment
- 6 in person visits over the course of approximately 3 months

WHAT DO I HAVE TO DO

You are responsible for...

- Bringing all your dogs in for the required visits
- Being available to answer questions about your dog
- Recording your dog's condition and behavior in your Owner Diary
- Notifying the study veterinarian of any observed unusual behaviors

ELIGIBILITY

*Requirements for Eligibility to Participate Include (but aren't limited to):

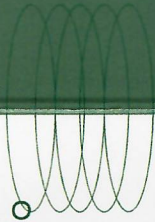

- Dog has been diagnosed with congestive heart failure due to mitral valve disease
- Dog cannot have a concurrent condition or disease that could interfere with study objectives
- Dog cannot be pregnant or lactating, or intended for breeding during the study
- Dog must meet mandatory washout period
- Dog must have received Furosemide, Pimobendan, ACE inhibitor and Spironolactone for at least 10 continuous days prior to Study Day 0.

Please talk to the study veterinarian for more information.

BENEFITS FOR PARTICIPANTS

For participation in the study, your dog will receive study-related treatment, including physical examinations, echocardiogram, radiographs, lab work, and treatment at no cost to you.
