

MINING SERVICE SHUTDOWNS IRON ORE & HARD ROCK PROCESSING AND HANDLING PLANT MAINTENANCE

FAST, SAFE AND EFFECTIVE ACCESS TO COMPLETE INSPECTIONS AND MAINTENANCE

PROJECT OVERVIEW:

Geovert have successfully completed Shutdowns without incident at FMG Cloud Break and Newmont Boddington Gold.

The works have involved replacing splitter chutes, wear liners and weld repairs on train load outs, as well as wear liner replacements in crushers and placement of wear max.

Geovert have also been undertaking wear liner advisory services with mapping of the wear levels and reporting these back through to the client so that forward planning can take place.

Large areas are able to be covered quickly with rope access as there is

no additional time for erecting and removing scaffolding. Rope access has led to significant cost savings for our clients with the elimination of scaffolding and an increase in production as the work front is accessed very early on in the shutdown process allowing more time to be spent on improving the integrity of the assets.
