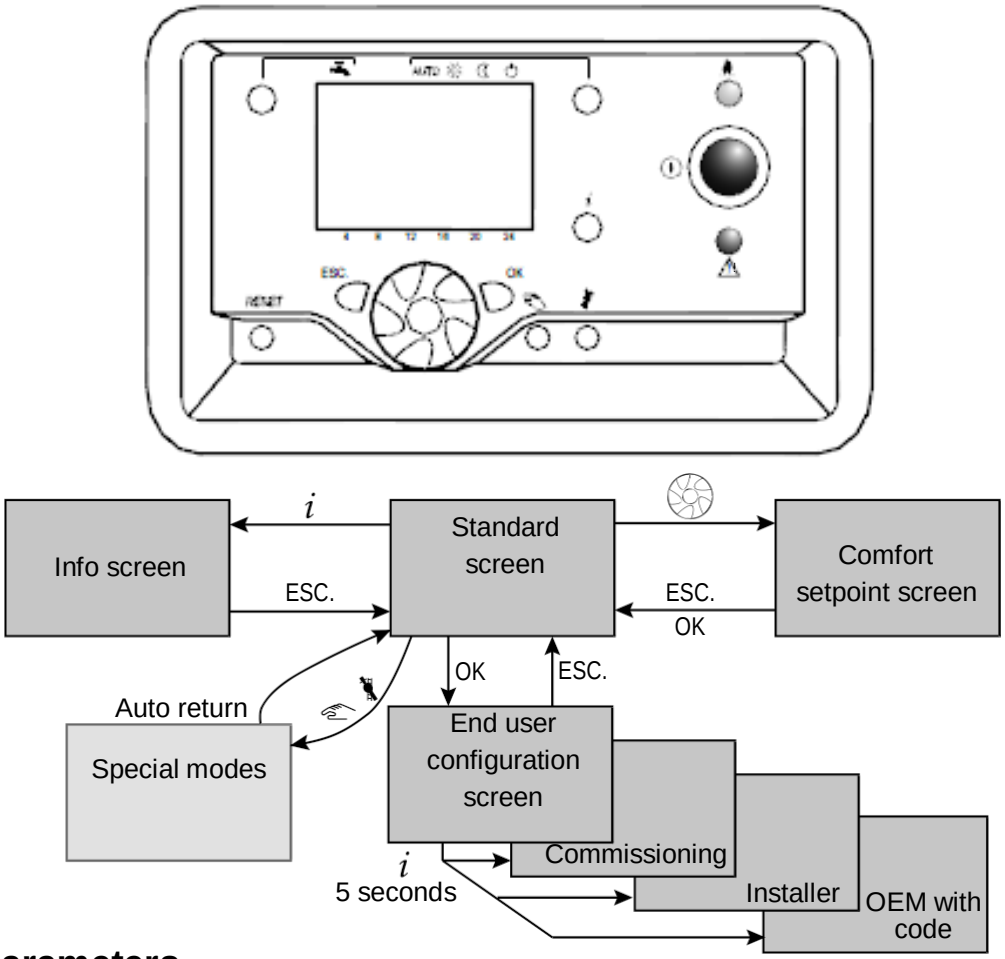
Hamworthy

SIMPLIFIED USE GUIDE

This section gives a list of parameters to be programmed for a basic boiler installation.

Navigation between the various screens



Main parameters

All the parameters below are accessible from the “End user” level.

Date and time		
1	Hour minutes	See paragraph 6.1, page 36
2	Day month	See paragraph 6.1, page 36
3	Years	See paragraph 6.1, page 36
Time schedule program for heating circuits 1, 2 and 3		
5xx	Adjustment of energy saving time schedules	See paragraph 7.1.2, page 40
Heating circuits 1, 2 and 3		
710 - 1010 - 1310	Comfort setpoint	See paragraph 7.1.4, page 41
712 - 1012 - 1312	Reduced setpoint	See paragraph 7.1.4, page 41
720 - 1020 - 1320	Slope of curve	See paragraph 7.1.5, page 41
Domestic hot water		
1610	Comfort setpoint	See paragraph 8.1.1, page 54
Error		
Current error diagnostic code		See chapter 16, page 96

SUMMARY

1. WARNINGS AND RECOMMENDATIONS

1.1. Symbols used in this document

INFORMATION: This symbol refers to information.

CAUTION: Failure to observe these guidelines may result in damage to the installation or other systems.

DANGER: Failure to observe these guidelines can result in electrocution.

1.2. Qualification of personnel for installation and maintenance

Installation and maintenance of the unit must only be performed by qualified professional technicians in compliance with the applicable regulations and practices, in particular the applicable national and local standards relative to low voltage electrical installations.

1.3. Safety guidelines

Always shut down the boiler and close the main gas supply before performing any work on the boiler controller.

2. ELECTRICAL CONNECTION

	**DANGER:**	**Before any intervention, make sure the main electrical power supply is switched off.**
	**CAUTION:**	**The ground conductor must be longer than the phase and neutral conductors.**
	**CAUTION:**	**Observe the phase polarity - neutral for electrical connections.**

2.1. Characteristics of electrical power supply

Electrical connections will only be made after other assembly operations (fixing,assembling,..) on the boiler will have been performed

The electrical installation must observe the CE standards relative to electrical connections and, in particular, the grounding connection.

This unit is designed to operate with a nominal voltage of 230 V, +10% / -15%, 50 Hz.

2.2. Cable cross-section

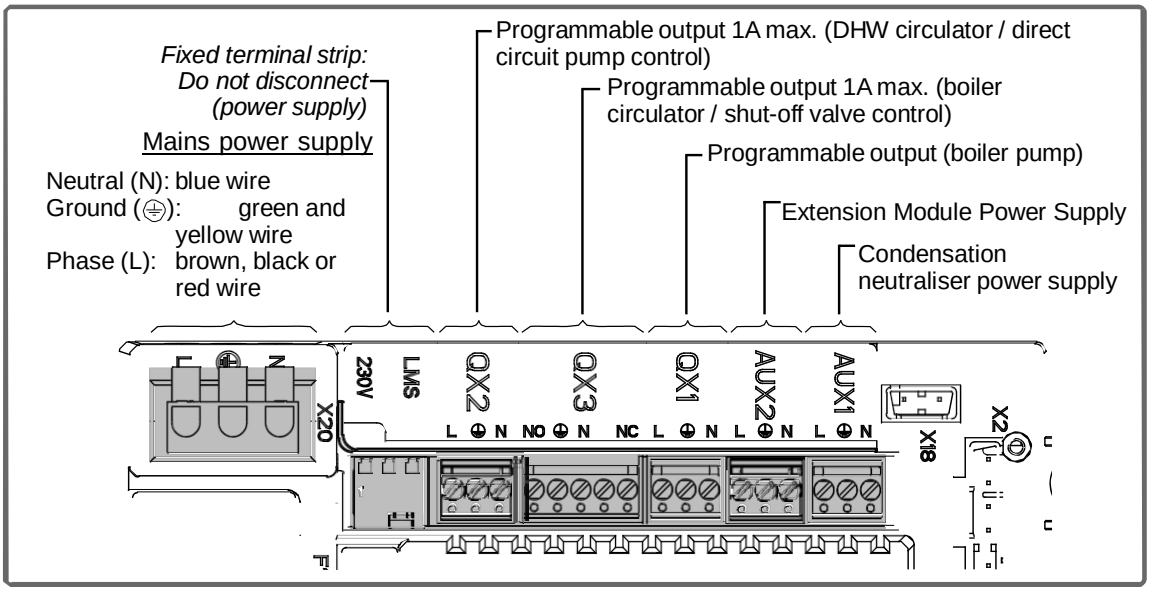
The cable cross-sections given below are given for information and do not release the installer from checking that they correspond to the needs and satisfy all applicable local and national standards.

If a cable is damaged, it must be replaced by the manufacturer, the manufacturer's after-sales service or any similar qualified person to avoid any danger.

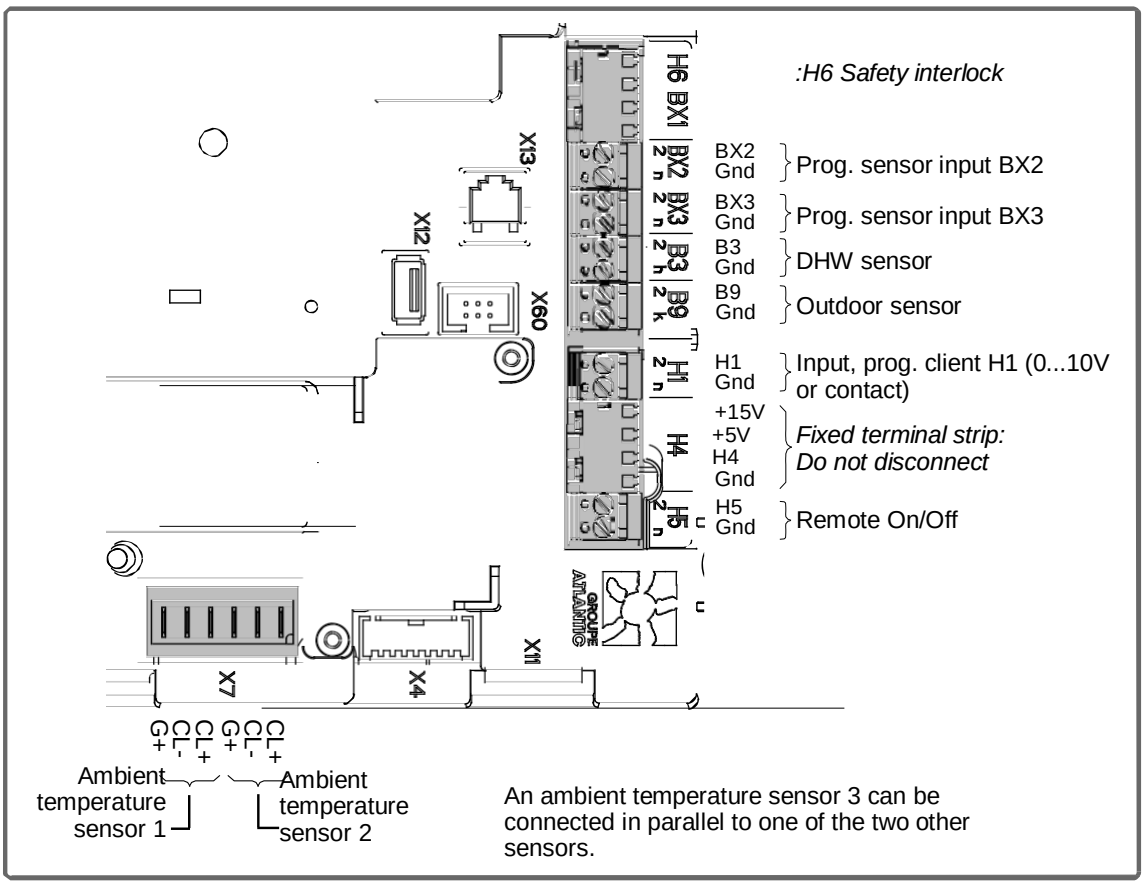
Cable	Terminal strips	Copper conductor cross-section
Power supply	Power supply	3 x 1,5 mm²
Power	QX1, QX2, QX3, AUX1, AUX2	3 x 1,5 mm²
Signals	BX2, BX3, B3, B9, H1, H5, ambient temperature sensors	2 x 0,5 mm²

2.3. Electrical connections on terminal strips

2.3.1. Power and high power terminal strips



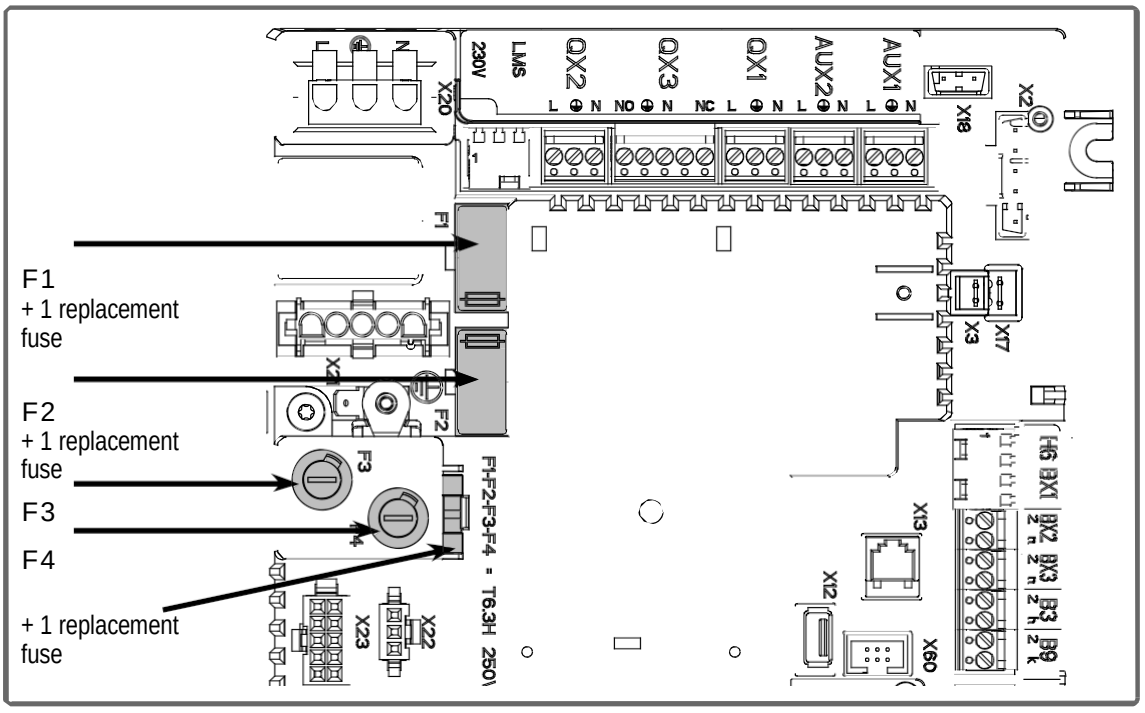
2.3.2. Signal terminal strips



2.4. Fuses

The boiler controller is equipped with 4 identical fuses (T 6,3 H 250V - 5x20 ceramic). Each has a specific location and function:

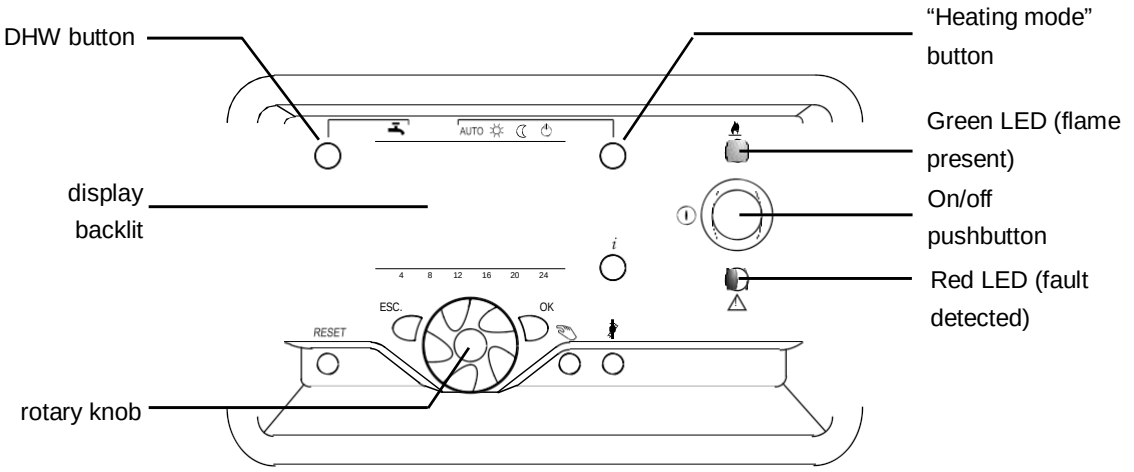
Reference	Function
F1 and F2	Boiler controller protection
F3	Protection of AVS75 / Service power supply
F4	Boiler fan and circulator protection



3. USER INTERFACE

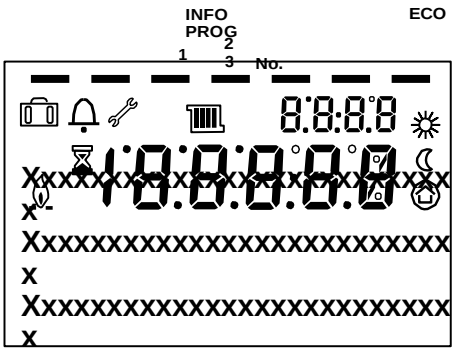
3.1. Presentation of interface:

- The boiler controller user interface comprises:
-a blue pushbutton (on/off),
- a backlit LCD display,
- 8 function keys,
- A rotary adjustment knob,
- A red LED:
  The LED comes on steady when a non-blocking fault is detected (following correction, the LED goes off). The LED flashes when a blocking fault is detected (in this case, the LED goes off after the fault has been corrected and the reset button on the interface has been pressed),
- A green LED:
  This LED comes on when the flame is present. All the customer settings and possible parameter definitions are made on this interface. It is also used to look up the information concerning operation of the boiler.



3.2. Display

The screen summarises the state of the boiler: operating mode, time, time schedule, boiler temperature, flame present, possible fault.



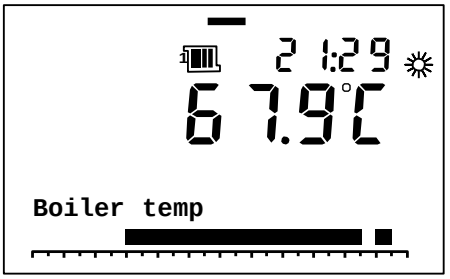
Pictograms:

- Comfort mode Programming
- **PROG**
- Reduced mode function
- **ECO** ECO
- Frost protection mode
- Vacation mode
- Process in progress
- 1 2 3 Heating circuit
- Flame present
- Maintenance
- Alarm
- **No.** Parameter number
- **INFO** Information

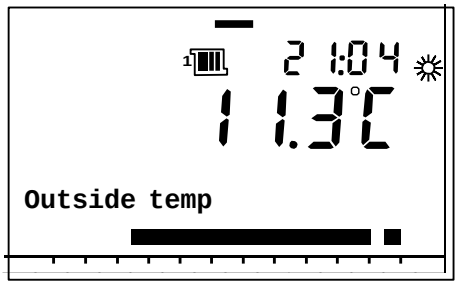
3.2.1. Predefined basic display

The basic display depends on the boiler operating mode chosen by the user:

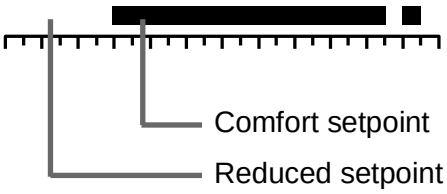
- In constant boiler flow temperature mode, the boiler flow water temperature is displayed.



- In regulation mode as a function of outdoor temperature or as a function of the room temperature or both, the outdoor temperature is displayed.

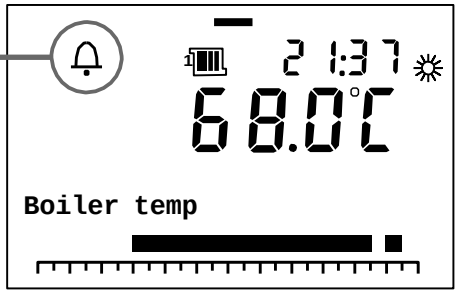


The bottom of the screen is displayed with a scale of 0 to 24 corresponding to the hours of a day.
The comfort setpoint request phases are represented by a black square above the scale. The other parts without square correspond to the reduced setpoint requests.



3.2.2. Display of a fault

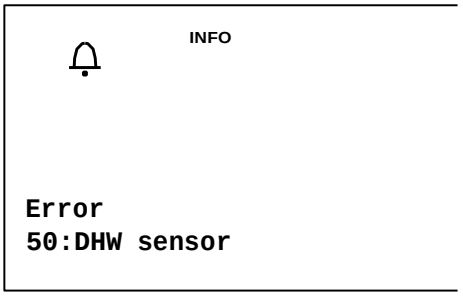
When a non-blocking fault is detected, a small bell is displayed at the top left of the screen. To identify the fault, press the information key. i .
This type of fault does not result in a blocking safety lockout requiring manual intervention.



Once the source of the fault has been eliminated, the bell automatically disappears.

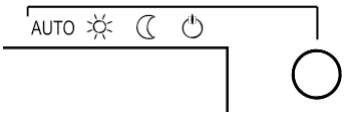
When the fault places the boiler in a safety lockout condition, the fault code and its text are displayed continuously on the screen. Similarly, a small bell appears at the top left of the screen.

To reset the boiler controller, eliminate the source of the fault, then press the reset button.



3.3. Operating modes

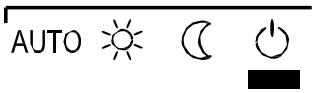
3.3.1. Heating mode



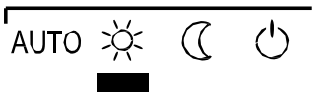
This is used to select the heating mode among the Standby, Comfort, Eco and Auto modes.

Note:
Where 2 or 3 independently adjusted heating circuits are used, press once on the heating mode key, then select the concerned circuit using the rotary adjustment knob and validate by OK.

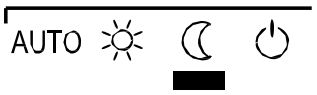
Standby No internal heat request is taken into account.
The frost protection function is active.
The external heat requests (0-10 V or LPB bus) remain active except with cascade application.



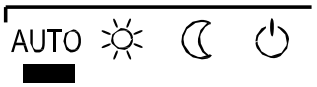
Comfort Continuous “comfort” mode.
The burner power is adapted to satisfy the heating setpoint.



Eco Permanent reduced mode.
The burner power is adapted to satisfy the reduced heating setpoint.

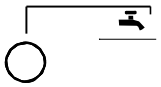


Auto Depending on the time schedule programmed, the regulator alternates the comfort and eco modes.
With a cascade application, engages the boiler in a cascade.

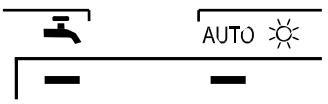


.3.2. DHW mode

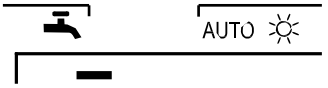
Activates / Deactivates DHW production.



DHW production activated



DHW production deactivated



3.3.3. Manual temperature mode

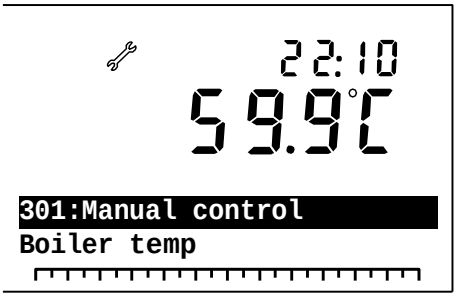
This mode is used to run the boiler in accordance with a special setpoint temperature.

Sequence of keys to access the function:

Access	Setting				Exit
	i	OK		OK	

The boiler regulates its power to achieve the defined setpoint.

While this function is active, an override signal[1] is generated to evacuate the calories.



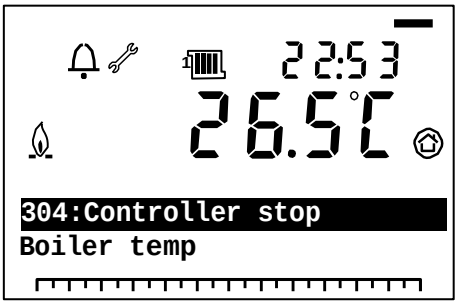
3.3.4. Manual power mode

This mode is used to manually define the burner heat release.

Sequence of keys to access the function:

Access	Setting				Exit
AUTO 3 seconds	*i*	OK		OK	AUTO 3 seconds

The relative power setpoint of[2] the burner is displayed on the screen.
The rotary adjustment knob is used to adjust the value of the setpoint in steps of 1 %.
While this function is active, an override signal[2] is generated to evacuate the calories.



1 *Forcing signal: causes switching on of the pumps, and/or opening of the 3 way valves of the connected heating circuits to remove the heat*

2 *Relative power: this is the effective power of the burner, referred to its modulation range. 0% corresponds to minimum power, 100% corresponds to maximum burner power. To calculate the burner load ratio (heat input percentage), the following formula is used:*

$$\%Q_{cal} = \frac{Power_{relative} \cdot (100 - \%Q_{min})}{100} + \%Q_{min}$$

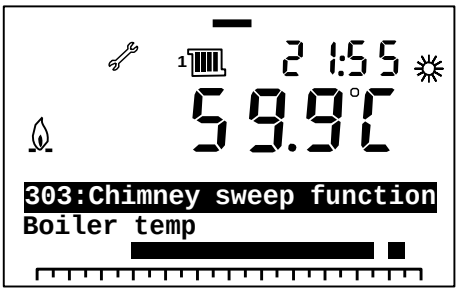
3.3.5. Cleaning mode

This mode is used to run the burner at full load.

Sequence of keys to access the function:

Access	Setting	Exit
	i OK OK	

The burner stops by cutout of the limiter electronic thermostat
While this function is active, an override signal[1] is generated to evacuate the calories.



1 Forcing signal: causes switching on of the pumps, and/or opening of the 3 way valves of the connected heating circuits to remove the heat.

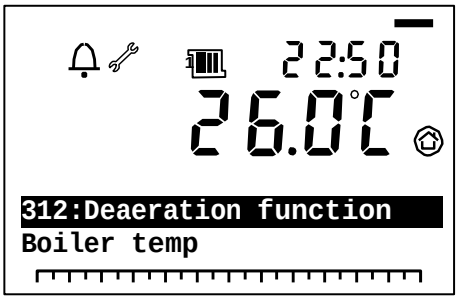
3.3.6. Purge mode

This mode is used to facilitate purging the installation water side (example, after the first time the installation is filled with water).

Sequence of keys to access the function:

Access	Exit		
3 seconds	automatic at end of purge	*or*	3 seconds

The pumps are switched on and off several times.



3.4. Adjustment of setpoints

3.4.1. Heating setpoint adjustment

The comfort temperature setpoint can be adjusted in 2 ways, either directly using the standard screen, or using the programming screen. The other temperature setpoints (reduced and frost protection) can only be adjusted using the programming screen.

1) Adjustment using standard screen:

Access	Setting	
OK	 OK choice of heating circuit	 OK adjustment of setpoint value

2) Adjustment using programming screen:

Access	Setting		
OK	 OK choice of heating circuit	 OK choice of setpoint to adjust	 OK adjustment of setpoint value

3.4.2. Adjustment of DHW setpoint

The DHW temperature setpoint can be adjusted using the programming screen between 40°C and 65°C.

Access	Setting	
OK	 OK Choice of *Domestic Hot Water header*	 OK adjustment of setpoint value

CAUTION: **The DHW setpoint must be defined in accordance with the applicable regulation to prevent any hazard with respect to legionella.**

3.5. Boiler states

On the basic display, you can scroll basic information concerning the boiler (see list below).

Access	Setting	Exit
i		ESC

1	Boiler temperature, heating circuit 1
2	Boiler temperature, heating circuit 2
3	Boiler temperature, heating circuit 3
4	Outdoor temperature
5	Min. outdoor temperature
6	Max. outdoor temperature
7	DHW temperature
8	State of heating circuit 1
9	State of heating circuit 2
10	State of heating circuit 3
11	DHW state
12	Heater status
13	Date
14	Customer service tel.

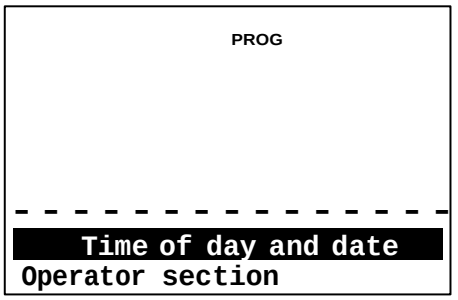
3.6. Parameter configurations

Depending on the functions controlled, the access level to the settings is different. There are 3 access levels:

U: End user,
M: Commissioning (acceptance, startup),
S: Specialist (technical level)

3.6.1. "End user" parameter configurations

The "end user" configuration mode is accessed on the standard display by pressing the OK key.
The « PROG » pictogram and the first 2 headers are displayed on the screen.



The rotary adjustment button is used to scroll the list of parameters. Once you have reached the parameter to be modified, press OK. The parameter value flashes. Adjust the value using the rotary knob.
The new value is validated by pressing OK

3.6.2. "Configuration" and "specialist" parameter configurations

The "Commissioning" and "Specialist" parameter configurations are accessed on the standard display by pressing the OK key, then on the information key for 5 seconds. i .

Use the rotary adjustment knob to reach the desired level: *Commissioning* or *Specialist*, then validate your selection by OK.
The Commissioning access level integrates the End User level . Similarly, the *Specialist* level integrates the *"Commissioning" level*.

3.6.3. Setting the various parameters

On the main menu, once you have obtained the desired level:

- Turn the control knob to scroll the menu.
- Once the desired menu appears, press OK to validate.
- Turn the control knob to adjust the setting.
- Press OK to validate the setting.

If no setting is performed during 8 minutes, the screen automatically returns to the basic display.

4. OPERATING CYCLES

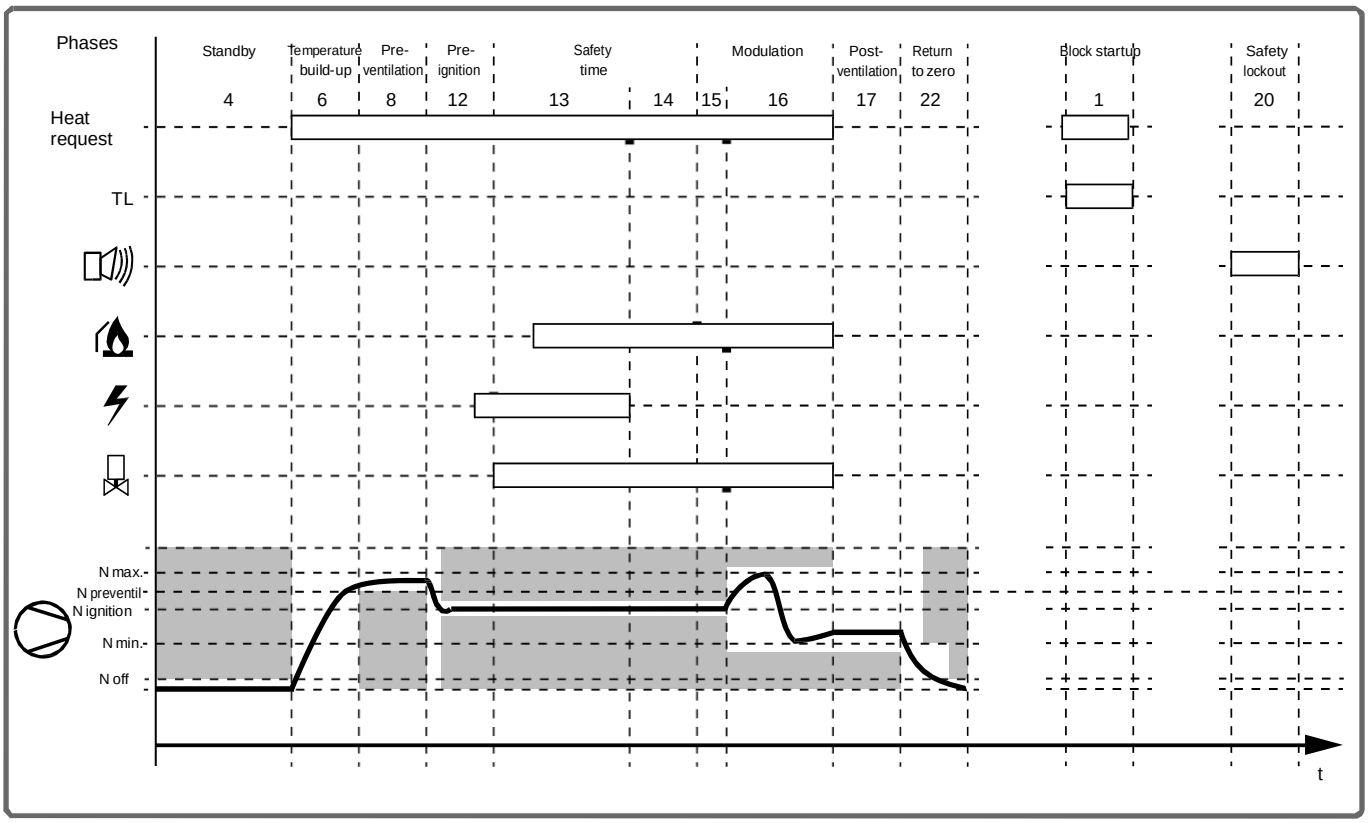


figure 1 - Cycles

Key:

TL = Limiter thermostat

= Alarm

= Flame detection

= Ignition electrode

= Gas valve

= Fan

N max. = max. authorised speed
N preventil = preventilation speed
N ignition = ignition speed
N min. = min. authorised speed with modulation
N off = speed less than 200 rpm and therefore considered as null

} Fan speed

Note:
In the event of failure, the boiler controller automatically initiates several startup attempts.

5. LIST OF PARAMETERS

Note: The “access” column indicates the level of accessibility to information or programming (E for end user, C for commissioning and S for specialist). The Commissioning accessibility level integrates the *End User* level. Similarly, the *Specialist* level integrates the *Commissioning*.

6. “USER INTERFACE” PARAMETERS

6.1. Setting the time

Line No.	Access	Programming	Possible values
1	E	Hours / minutes	00:00 ... 23:59
2	E	Day / month	01.01 ... 31.12
3	E	Year	1900 ... 2099
5	C	Start of summertime	01.01 ... 31.12
6	C	End of summertime	01.01 ... 31.12

The controller has an annual clock which indicates the hour, day and date.
For correct operation of the programs, the hour and date must be correctly set on the clock.

N.B: Summer time / winter time switchover
The dates have been programmed for transition to the summer time and winter time. The time automatically goes from 2^{am} (winter time) to 3^{am} (summer time) or from 3am (summer time) to 2am winter time (on the first Sunday following the respective date.

6.2. User interface

Line No.	Access	Programming	Possible values
20	E	Language	English | Deutsch | Français | Italiano | Nederlands | Español
22	C	Info	Temporarily | Permanently
26	C	Operation lock	Off | On
27	C	Programming lock	Off | On
28	C	Direct adjustment	Automatic storage | Storage with confirmation
29	E	Units	°C, bar | °F, PSI

Info (22):

- ***Temporary:***
  After pressing the “Info” key, the display returns to the “predefined” basic display after 8 minutes or by pressing the operating mode key.
- ***Continuous:***
  After pressing the “Info” key, the display goes to the standard “new” display after 8 minutes max. The last information selected is visible on the new basic display.

Operation lock (26):
If the operation lock is activated, the following control elements can no longer be set: Heating circuit mode, DHW mode, temperature setpoint, comfort ambient temperature (knob), occupation key.

Program lock (27):

If the program lock is activated, the setting values are displayed but cannot be modified.

- ***Temporary suspension of program***
  The program lock can be temporarily deactivated on the program. To do so, simultaneously press the OK and ESC keys for at least 3 seconds. Temporary suspension of the program lock remains effective until the programming context is exited.
- ***Permanent suspension of program***
  Start with a temporary suspension, then cancel the “Program lock” on line 27.

Direct setting (28):

- ***Automatic***
  A setpoint correction using the knob is validated with no special confirmation (elapsed time) or by pressing the OK key.
- ***With validation***
  A setpoint correction with the button will only be validated after the OK key has been pressed.

6.3. Heating circuit assignment

Line No.	Access	Programming	Possible values
42	C	Assignment device 1	Heating circuit 1 | Heating circuits 1 and 2 | Heating circuits 1 and 3 | All heating circuits
44	C	Operation HC2	Jointly with HC1 | Independently
46	C	Operation HC3/P	Jointly with HC1 | Independently

Assignment of unit 1 (42)

As room unit 1, the action generated by the corresponding user interface can be assigned to heating circuit 1 or to the two heating circuits. The latter case applies when the installation has 2 heating circuits and only one room unit

Control of heating circuit 2 (44)

Depending on the setting on line 40 (parameter accessible or QAA75 on QAA78: ambient temperature control module), the action (operating mode key or knob) can be defined on room unit 1, the user interface or the control component for heating circuit 2.

- **Common with HC1**
  Control of heating circuits 1 and 2 is shared.
- **Independent**
  The control action is displayed on the screen each time an operating mode key or knob is used.

Control of heating circuit (46)

Depending on the setting on line 40 (parameter accessible or QAA75 on QAA78: ambient temperature control module), the action (operating mode key or knob) can be defined on room unit 1, the user interface or the control component for heating circuit 3.

- **Common with HC1**

  Control of heating circuits 1 and 3 is shared.

- **Independent**

  Any change of operating mode or nominal temperature adjustment must be performed in the programming.

6.4. Software version

Line No.	Access	Programming
70	C	Software version

The indication gives the current version of the user interface.

7. “HEATING CIRCUITS” PARAMETERS

The boiler controller can manage up to 3 heating circuits

The type of heating circuit (direct pump or mixing valve) is self-defined in accordance with the connection (or not) of a flow temperature sensor.

Management of the heating circuit by the boiler controller (direct or mixed) requires use of an outdoor temperature sensor (QAC34 connected to B9, see section 2.3.2, page 10).

In order to have heating circuits with a valve, an extension module per heating circuit must be used.

The names of the sensors, pumps and valves used are:

	Sensor	Pump	Valve
CC1	B1	Q2	Y1/Y2
CC2	B12	Q6	Y5/Y6
CC3	B14	Q20	Y11/Y12

The following functions are available for each heating circuit independently:

- Adjustment of energy saving time schedules
- Adjustment of vacation programs
- Adjustment of setpoints
- Adjustment of heating curves
- Operation optimisation functions
- Adjustment of control of valve and pump actuators

7.1. Basic settings

7.1.1. Operating mode

Operation of heating circuits 1, 2 and 3 is directly controlled by the operating mode key (see chapter 3.3, page 14).

7.1.2. Time schedule program (heating circuits 1, 2 and 3, DHW, 5)

Line No.					Access	Programming	Possible values
CC1	CC2	CC3	DHW	5			
500	520	540	560	600	E	Preselection	Mo-Su | Mo-Fr | Sa-Su | Mo…Su
501	521	541	561	601	E	First period start time	00:00 ... 24:00
502	522	542	562	602	E	First period stop time	00:00 ... 24:00
503	523	543	563	603	E	Second period start time	00:00 ... 24:00
504	524	544	564	604	E	Second period stop time	00:00 ... 24:00
505	525	545	565	605	E	Second period start time	00:00 ... 24:00
506	526	546	566	606	E	Second period stop time	00:00 ... 24:00
516	536	556	576	616	E	Default values	No | Yes

Several control programs are available for the heating and DHW production circuits. They are set up in « Automatic » mode and control the temperature level changes (and therefore the associated setpoints (reduced and comfort)) in accordance with the change times set.

Enter the change times:
The change times can be set in a combined way, i.e. identical times for several days or several different times for certain days. By preselecting groups of days (Monday … Friday and Saturday … Sunday, for example) with the same change times, you will considerably reduce the time spent in setting up the change program.

All the time schedule programs can be reset to the factory settings (lines 516, 536, 556, 576 and 616). Each time schedule program has its own control line for reinitialisation. In this case, the individual settings are lost.

7.1.3. Vacation (heating circuits 1, 2 and 3)

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
641	651	661	E	Preselection	Period 1 | ... | Period 8
642	652	662	E	Begin (dd.mm)	01.01 ... 31.12
643	653	663	E	End (dd.mm)	01.01 ... 31.12
648	658	668	E	Operating level	Frost protection | Reduced

The « vacation » program allows you to change the heating circuits on an operational level selected in accordance with the date (calendar).

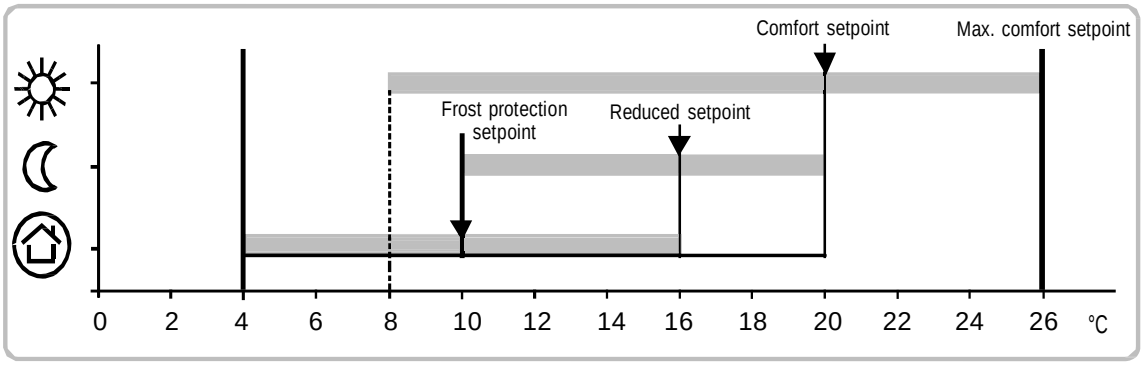
CAUTION: **The « vacation » program is active in automatic mode only.**

7.1.4. Setpoint values

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
710	1010	1310	E	Comfort setpoint	4 ... 35 °C
712	1012	1312	E	Reduced setpoint	4 ... 35 °C
714	1014	1314	E	Frost protection setpoint	4 ... 35 °C
716	1016	1316	S	Comfort setpoint max	4 ... 35 °C

Ambient temperature:
The ambient temperature can be set according to different setpoint values. Depending on the mode chosen, the adjustment points are activated and provide different levels of ambient temperature.

The configurable adjustment point ranges are defined by their interdependencies as shown in the chart below.



Frost protection :
The protection mode automatically prevents too sharp a drop in the ambient temperature. In this case, the control system adopts the frost protection adjustment point.

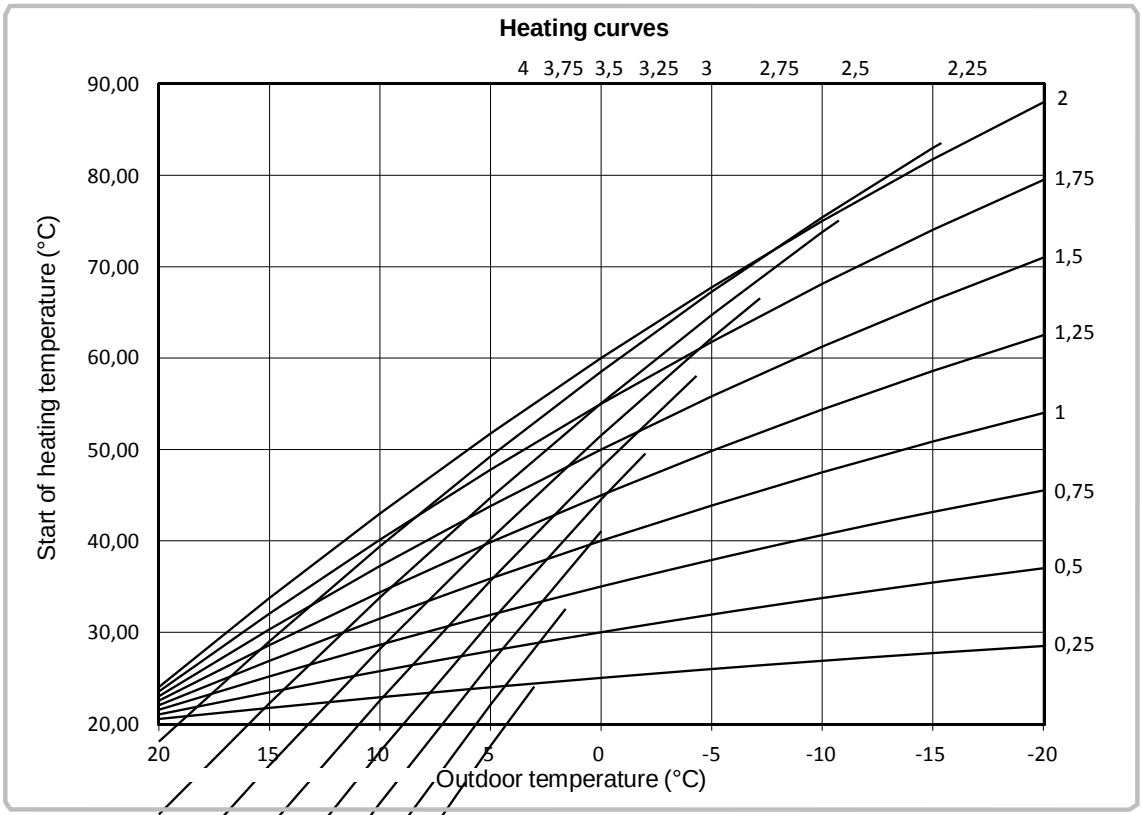
7.1.5. Heating curve

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
720	1020	1320	E	Heating curve slope	0.10 ... 4.00
721	1021	1321	S	Heating curve displacement	-4,5 ... 4,5 °C
726	1026	1326	S	Heating curve adaptation	Off | On

Heating curve slope
Depending on the heating characteristics, the controller will calculate the flow temperature setpoint which will be used to regulate the flow temperature in accordance with the atmospheric conditions. Different adjustments allow you to adapt the heating characteristic so that the heating capacity, and therefore the ambient temperature, corresponds to the individual needs.

CAUTION:

The heating curve is adjusted with respect to an ambient temperature setpoint of 20°C. If the ambient temperature is changed, the flow temperature setpoint is automatically recalculated. This does not modify the adjustment and comes down to automatically adapting the curve.



Translation of heating curve.

Any offset of the curve will modify the flow temperature overall and regularly over the entire outdoor temperature range. In other words, the offset must be corrected when the ambient temperature is globally too high or too low.

Adaptation of heating curve

The adaptation allows the controller to automatically adapt the heating curve to the actual conditions. This correction function can only be activated and deactivated.
In the latter case, there is no need to correct the slope and the offset.

INFORMATION:

To activate the function, the following conditions must be satisfied

- An ambient temperature sensor must be connected.
- The « ambient temperature influence » parameter must be set between 1 and 99.
- The reference room (where the ambient temperature sensor is installed) must not have a thermostatic valve. If it does, it must be completely open.
- Activation of this function requires an adaptation period which can take more or less time (around 1 week) depending on the weather conditions and the stability of the ambient temperature setpoint.

7.1.6. Flow temperature setpoint

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
740	1040	1340	C	Flow temp setpoint min	8 ... 95 °C
741	1041	1341	C	Flow temp setpoint max	8 ... 95 °C

Limits the flow temperature setpoint (as min. or max.) calculated by the water law (heating curve).

7.1.7. Flow temperature setpoint for room thermostat

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
742	1042	1342	S	Flow temp setpoint room stat	8 ... 95 °C

If a room thermostat is defined on an input Hx, the flow setpoint for the heating circuit set will apply here.

7.1.8. Heat request delay

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
746	1046	1346	C	Delay heat request	0 ... 600 s

If a valve is used as a heating circuit control element (in place of a pump), the heat request sent to the generator may be delayed for the time taken by the valve to achieve the fully open position.

7.2. Optimisation

7.2.1. ECO functions

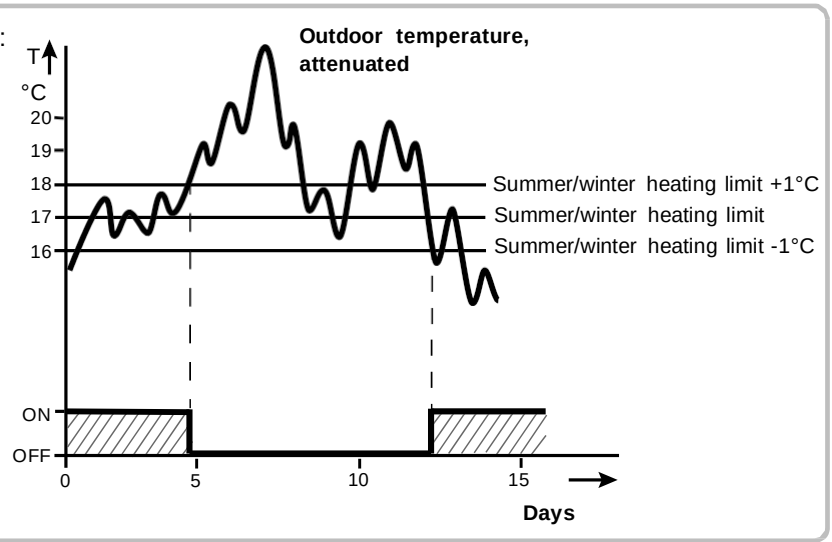
Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
730	1030	1330	E	Summer/winter heating limit	8 ... 30 °C
732	1032	1332	S	24-hour heating limit	-10 ... 10 °C

Summer/winter switchover:
The summer/winter switchover activates/deactivates the heating system during the year in accordance with the temperature. The changeover takes place automatically when the automatic mode is selected, thus eliminating the need by the user to switch on/off the heating system. Any change to the input value shortens or extends the respective annual periods (summer/winter).

- If the value is increased:
  The transition to winter mode is advanced, and the transition to summer mode is delayed.
- If the value is decreased:
  The transition to winter mode is delayed and the transition to summer mode is advanced.

INFORMATION:
This function is inactive in continuous comfort temperature mode (sun icon).
The controller displays "ECO".
The outdoor temperature is attenuated to take account of the building's dynamic's

Example:



Daily heating limit :
The daily heating limit is used to switch on/off the heating system during the day depending on the outdoor temperature. This function is mainly used during the intermediate seasons (spring/autumn) to quickly respond to temperature deviations.

In this way, in the following example, the temperature is 18 °C, calculated as follows:

Heating comfort setpoint. (710)	22 °C
Heating limit over 24 hours (732)	-3 °C
Switchover temperature (710 – 732) =	19 °C
Heating off	
Differential (fixed)	-1 °C
Switchover temperature =	18 °C
Heating on	

Any change to the value entered will shorten or increase the respective heating periods.
- If the value is increased: the transition to heating mode will be advanced ; The transition to ECO mode will be delayed.
- If the value is decreased: the transition to heating mode will be delayed ; the transition to ECO mode will be advanced.

INFORMATION:
This function is inactive in continuous comfort temperature mode.
The controller displays "ECO".
The outdoor temperature is attenuated to take account of the building's dynamic's

7.2.2. Influence of ambient temperature

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
750	1050	1350	S	Room influence	1 ... 100 %

Types of control :

When an ambient temperature sensor is used, 3 different types of control are possible

SETTING	TYPE OF CONTROL
- - - %	Simple control based on outdoor conditions *
1...99 %	Control based on outdoor conditions, with influence of ambient temperature *
100 %	Control based on ambient temperature only

** Requires connection of an outdoor sensor.*

Simple control based on outdoor conditions

The flow temperature is calculated by the heating curve in accordance with the average outdoor temperature

Since the control does not take account of the ambient temperature for this adjustment, this type of control requires correct adjustment of the heating curve.

Control based on outdoor conditions, with influence of ambient temperature.

The difference between the ambient temperature and the setpoint is measured and taken into account for adjustment of the temperature. This makes it possible to take account of possible heat inputs and ensures a better uniformity of the ambient temperature.

The influence of the temperature difference is defined in the form of a percentage. The configurable value will be proportionally higher and consistent with the quality of the installation in the reference room (precise ambient temperature, correct location of sensor, etc.).

Example:

60 % approx.: good quality installation

20 % approx.: poor quality installation

Control according to ambient temperature only

The flow temperature is adjusted in accordance with the ambient temperature setpoint, the actual ambient temperature and its evolution. For example, a minor increase in the ambient temperature will result in immediately lowering the flow temperature.

INFORMATION:

To activate the function, the following conditions must be satisfied

- An ambient temperature sensor must be connected.
- The “ambient temperature influence” parameter must be set between 1 and 99 or to 100%.
- The reference room (where the ambient temperature sensor is installed) must not have a thermostatic valve. If it does, it must be completely open.

7.2.3. Limitation of ambient temperature

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
760	1060	1360	S	Room temp limitation	0,5 ... 4 °C

The ambient temperature limitation function is used to switch off the circulating pump when the ambient temperature exceeds the current setpoint by more than the set differential. The circulating pump is again activated as soon as the ambient temperature drops below the current ambient temperature setpoint. If the ambient temperature limitation function is active, no heat request is transmitted to the generator(s).

7.2.4. Accelerated heating

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
770	1070	1370	S	Boost heating	0 ... 20 °C

In fast heating mode, the new setpoint is reached more quickly when switching from the reduced setpoint to the comfort setpoint, thus shortening the temperature build-up time. During the fast heating operation, the room temperature setpoint is increased by the value set. An increase in the setting results in a shorter temperature build-up time. On the other hand, a decrease in the setting results in a longer period.

INFORMATION: Fast heating is possible with or without the room temperature sensor.

7.2.5. Accelerated lowering of heating

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
780	1080	1380	S	Quick setback	Off | Down to reduced setpoint | Down to frost prot setpoint

During accelerated lowering of the heating, the heating circuit pump is disconnected and, if a mixing valve type circuit is used, the mixing valve is closed.

INFORMATION: The pump is operated in continuous mode to maintain the heating circuit pump activated during the accelerated temperature lowering operation.

- **Operation with room temperature sensor**
  With an ambient temperature sensor, the function disconnects the heating until the ambient temperature has dropped and reached the reduced setpoint or the frost protection level. When the ambient temperature has dropped down to the reduced or frost protection level, the heating circuit pump is activated and the mixing valve is released.

- **Operation without room temperature sensor**
  Accelerated lowering of the temperature cuts off the heating for a defined period of time in accordance with the outdoor temperature and the building time constant.

7.2.6. Optimisation on startup and stop

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
790	1090	1390	S	Optimum start control max	00:00 ... 06:00
791	1091	1391	S	Optimum stop control max	00:00 ... 06:00

Maximum optimisation on activation
The change of temperature levels is optimised to achieve the comfort setpoint during the changeover periods.

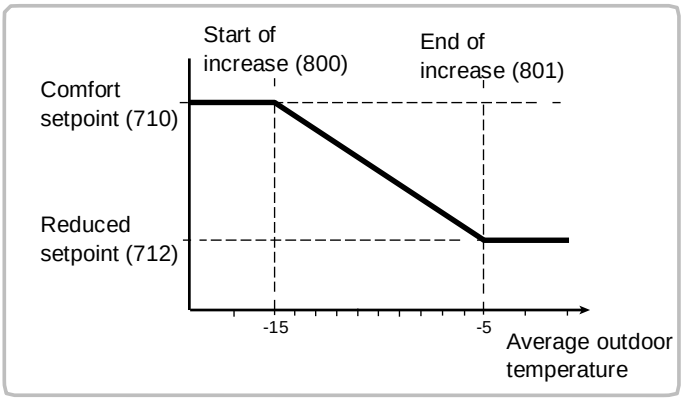
Maximum optimisation on cutout
The change of temperature levels is optimised to achieve the comfort setpoint - 1/4 °C during the changeover periods.

7.2.7. Increase of reduced setpoint

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
800	1100	1400	S	Reduced setp increase start	-30 ... 10 °C
801	1101	1401	S	Reduced setp increase end	-30 ... 10 °C

This function is mainly used in heating systems equipped with limited energy supply levels (homes with low energy profile, for example). In this case, when the outdoor temperatures are low, adjustment of the temperature would take too much time.

Increasing the reduced temperature setpoint prevents excess cooling of the rooms to shorten the temperature adjustment period on transition to the comfort setpoint.



7.2.8. Protection pump circuit overheat

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
820	1120	1420	S	Overtemp prot pump circuit	Off | On

In heating installations with pump circuit, the heating circuit flow temperature may be higher than the flow temperature required by the heating curve subsequent to needs generated by other consumers (heating circuit with mixing valve, DHW load, external heat request) or to configuration of a minimum boiler temperature. By an excessively high outlet temperature, this heating circuit with pump would therefore be overheated. The overheating protection function for pump circuits is used to ensure, by activation or cutout of the pump, that the heating circuit energy supply corresponds to the heating curve demand.

7.2.9. Evacuation of surplus heat

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
861	1161	1461	S	Excess heat draw	Off | Heating mode | Always

The following functions can trigger evacuation of the surplus heat:
- Inputs Hx
- Adiabatic cooling of tank
- Evacuation of surplus heat from solid fuel boiler

If evacuation of surplus heat is activated, the surplus energy can be evacuated by the room heating system. This can be adjusted separately for each heating circuit.

Off
Evacuation of surplus heat deactivated.

Heating mode
Evacuation of surplus heat only takes place when the regulator is in heating mode.

Continuous
Evacuation of surplus heat takes place in all modes.

7.2.10. Storage tank / primary regulator

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
870	1170	1470	S	With buffer	No | Yes

If a storage tank is used, it is necessary here to specify if the heating circuit is supplied from the storage tank. The temperature of the boiler storage tank serves as criterion for release of possible additional energy sources.

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
872	1172	1472	S	With prim contr/system pump	No | Yes

You can specify if the heating circuit is supplied from the primary regulator or by the primary pump (depending on installation).

7.2.11. Temperature level switchover

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
898	1198	1498	S	Operating level changeover	Frost protection | Reduced | Comfort

An external clock on input Hx is used to select the temperature level of the heating circuits.

7.2.12. Operating mode changeover

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
900	1200	1500	S	Optg mode changeover	None | Protection | Reduced | Comfort | Automatic

In the event of an external change by input H (on extension module only), the operating mode to which the change will be applied must be defined beforehand.

7.3. Control of actuators

7.3.1. Uninterrupted operation of pumps

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
809	1109	1409	S	Continuous pump operation	No | Yes

The pump is operated in continuous mode to inhibit cutout of the pump during an accelerated temperature lowering operation and regulation to the room temperature setpoint (room temperature thermostat, room temperature sensor or room temperature model).

- **Yes**
  The boiler heating circuit pump also remains activated during accelerated lowering of the temperature and when the room temperature setpoint has been achieved.

- **No**
  The boiler heating circuit pump can be stopped during an accelerated temperature lowering operation or when the room temperature setpoint has been achieved.

7.3.2. Control by mixing valve

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
830	1130	1430	S	Mixing valve boost	0 … 50 °C
832	1132	1432	S	Actuator type	2-position | 3-position
833	1133	1433	S	TOR Switching differential	0 … 20 °C
834	1134	1434	S	Actuator running time	30 ... 873 s

Heightening of the mixing valve
The controller adds the increase defined here to the current flow setpoint and uses the result as temperature setpoint for the heat generator.

Type of servomotor
The type of servomotor setting modifies the behaviour of the regulation on the mixing valve servomotor.
The regulator controls on/off and 3-point servomotors

On/Off Differential (TOR)
For the On/Off servomotor, the “On/Off Differential” parameter must be adapted if necessary. This is not necessary for the 3-point servomotor

Servomotor travel time
On a 3-way valve, the servomotor travel time can be adjusted. On a 2-way valve, it is not possible to adjust the servomotor travel time.

7.3.3. Speed-controlled pump

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
880	1180	1480	S	Pump speed reduction	Operating level | Charactéristic

The number of rounds of the heating pump can be reduced in accordance with the temperature level or in accordance with the characteristic.

Temperature level
The speed of the heating circuit pump is calculated in accordance with the mode level.
In comfort mode (including optimisation) or when the controlled slab drying function is active, the pump is controlled to the maximum speed configured. In reduced mode, the pump is controlled to the minimum speed configured.

Characteristic
The rotation speed of the heating circuit pump is calculated in accordance with the effective flow temperature measured and the actual flow setpoint. The common flow setpoint is used for the value measured. If there is no sensor on the common flow line, the boiler flow temperature measured is used. The temperature measured is attenuated by a filter (configurable time constant).

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
882	1182	1482	S	Pump speed min	0 ... 100 %
883	1183	1483	S	Pump speed max	0 ... 100 %

The heating circulating pump minimum and maximum rotation speeds can be defined.

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
888	1188	1488	S	Curve readj at 50% speed	0 ... 100 %

Correction of flow setpoint by reduction of pump rotation speed by 50%.

The correction is calculated as the difference between the flow setpoint according to the heating curve and the actual ambient temperature setpoint.

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
889	1189	1489	S	Filter time const speed ctrl	0 ... 20 min

The time constant is adjusted here to filter the flow temperature. This filtered time delay is used to calculate the speed of the modulating pump.

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
890	1190	1490	S	Flow setp readj speed ctrl	No | Yes

Here, you can specify if the calculated flow setpoint correction must be integrated in the temperature request or not.

7.4. Controlled slab drying

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
850	1150	1450	C	Floor curing function	Off | Functional heating | Curing heating | Functional/curing heating | Curing/functional heating | Manually
851	1151	1451	C	Floor curing setp manually	0 ... 95 °C
855	1155	1455	E	Floor curing setp current	0 ... 95 °C
856	1156	1456	E	Floor curing day current	0 ... 32

This function is used for controlled drying of slabs. It adjusts the flow temperature to a temperature profile. Drying is performed by heating the slab through the heating circuit with a mixing valve or a pump.
The « current drying day » is displayed with parameter 855.

« Controlled drying » function:

- ***None :***
  The function is deactivated.

- ***Functional heating (Fh):***
  The first part of the temperature profile is completed automatically.

- ***« Ready to occupy » heating (Bh):***
  The second part of the temperature profile is completed automatically.

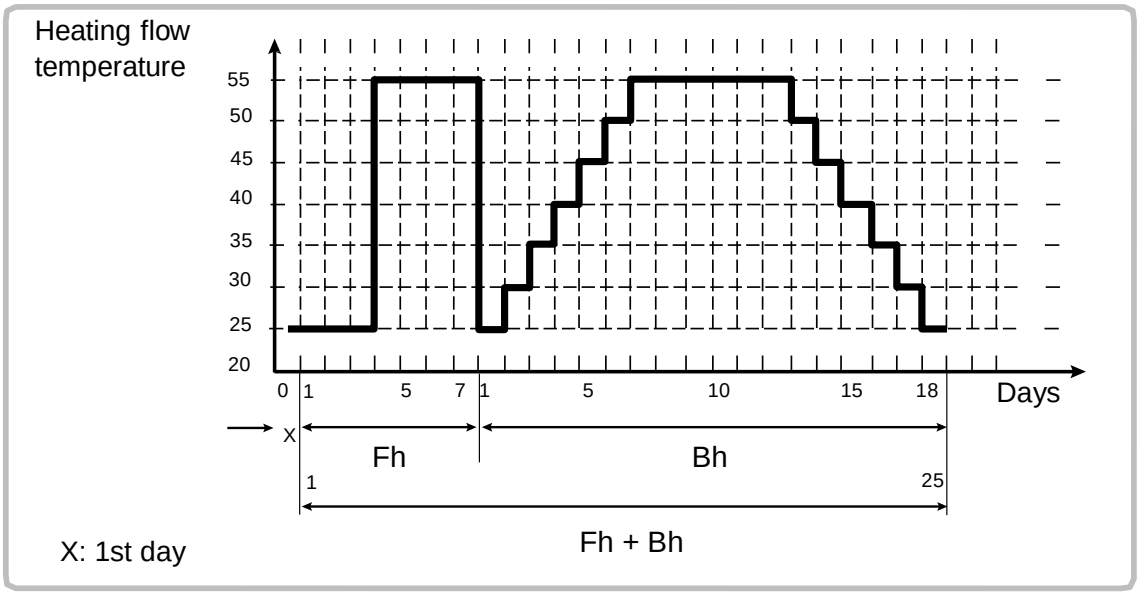
- ***Functional heating / "ready to occupy" heating (Fh + Bh):***
  The complete temperature profile (1st and 2nd part) is executed automatically.

- ***« Ready to occupy » heating / functional heating (Bh + Fh):***
  The complete temperature profile (2nd part and 1st part) is executed automatically.

- ***Manual:***
  No temperature profile is completed but the control is executed in accordance with the « manually controlled drying setpoint ». The function terminates automatically after 25 days.

INFORMATION:

- It is absolutely necessary to observe the standards and instructions of the building contractor !
- This function will only be active provided the installation has been properly done (hydraulic and electrical aspects, adjustments). Otherwise, the slabs to be dried could be damaged !
- The function can be interrupted prematurely by selecting « None ».
- The maximum flow temperature limitation remains active.



Manual drying setpoint

The flow temperature setpoint for the manual « controlled slab drying » function can be adjusted separately for each heating circuit.

Current drying setpoint

Displays the current flow temperature setpoint for the controlled slab drying function.

Current drying day

Displays the current day of the controlled slab drying function.

CAUTION: **After a power cutout, the controlled drying function resumes at the moment where the power cutout took place.**

8. « DOMESTIC HOT WATER » PARAMETERS

The boiler controller recognises that it must control a DHW circuit when a sensor or a thermostat is connected to its input B3.

The boiler controller can control a DHW actuator (DHW pump or valve Q3 to be defined at QX2).

The names of the sensor and the pump used are:

	Sensor	Pump
DHW	B3	Q3

The following functions are available on the DHW circuit :

- Adjustment of energy saving time schedules
- Adjustment of vacation programs
- Adjustment of setpoints
- Anti-legionella function
- DHW storage tank with load management

The boiler controller shows the DHW menu and the DHW tank when a sensor or a thermostat is connected to input B3.

The control adjusts the DHW temperature to the desired setpoint in accordance with the energy saving time schedule or continuously. In this case, the priority can be given to the DHW load function on the heating circuits.

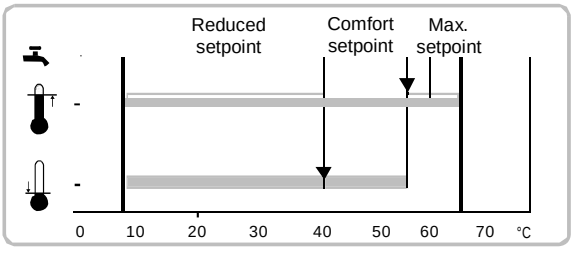
The controller has a configurable anti-legionella function designed to ensure protection against legionella in the tank and pipes. The circulating pump is controlled in accordance with the energy savings time schedule and the current operating mode.

8.1. Basic settings

8.1.1. Setpoint value

Line No.	Access	Programming	Possible values
1610	E	Nominal setpoint	8 ... 80 °C
1612	S	Reduced setpoint	8 ... 80 °C
1614	S	Nominal setpoint max	8 ... 80 °C

The DHW is heated to various setpoint values.
These setpoints depend on the operating mode selected and are used to achieve the desired temperatures in the DHW tank.

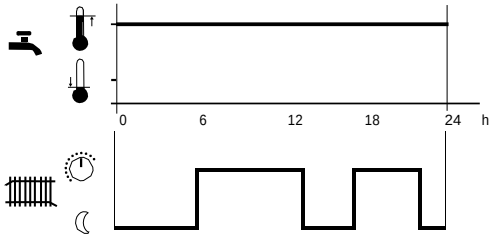


8.1.2. Release

Line No.	Access	Programming	Possible values
1620	C	Release	24h/day | Time programs HCs | Time program 4/DHW

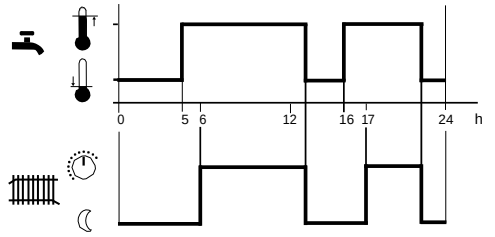
24h/24
Whatever the time schedule programs, the DHW temperature is maintained permanently to the nominal DHW setpoint.

Example:

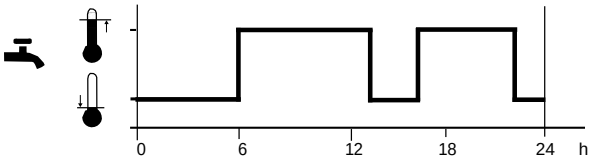


Time schedule programs of heating circuits
Depending on the time schedule programs of the heating circuits, the DHW setpoint will vary between the comfort DHW setpoint and the reduced DHW setpoint. The first switching point of each phase advances by one hour each time.

Example:



Time schedule program 4/DHW
Time schedule program 4 of the local controller is taken into account for the DHW mode. The change between the comfort and reduced DHW setpoints takes place at the change times defined for this program. In this way, the DHW is loaded independently of the heating circuits.



8.1.3. Priority

Line No.	Access	Programming	Possible values
1630	C	Charging priority	Absolute | Shifting | None | MC shifting, PC absolute

If power is needed simultaneously for the heating and DHW circuits, the DHW priority function ensures that the boiler power is supplied with priority to the DHW during a DHW load cycle.

Absolute
The heating circuit with valve or pump is blocked until the DHW has achieved the desired temperature.

Sliding
If the heating power of the generator is not sufficient, the heating circuits with valve and with pump are restricted until the hot water has reached the desired temperature.

None
DHW charging takes place in parallel to operation of the heating system. If the sizing of the boilers and the heating circuits with valve is too tight, in the event of a high heating load, the DHW setpoint may not be achieved because there is too much heat passing into the heating circuit.

Sliding, absolute
The heating circuits with pump are cut off until the hot water has reached the desired temperature. If the heating power of the generator is insufficient, the heating circuits with mixing valves are restricted until the hot water has reached the desired temperature.

8.2. Anti-legionella function

Line No.	Access	Programming	Possible values
1640	S	Legionella function	Off | Périodically | Fixed weekday

- **Periodic**
  The anti-legionella function is repeated in accordance with a defined frequency (line 1641).

- **Fixed day in week**
  The anti-legionella function can be activated on a fixed day of the week (line 1642). With this setting, the heating at the anti-legionella setpoint takes place on a fixed day of the week without taking account of the DHW tank temperatures during the previous period.

CAUTION: **During the period during which the anti-legionella function operates, there is a burn hazard when valves are opened.**

Line No.	Access	Programming	Possible values
1641	S	Legionella funct periodically	1 ... 7

The periodic *anti-legionella function setting* determines the number of the days after which the anti-legionella function must be reactivated (this adjustment only works provided the *anti-legionella function* is set to Periodic).

Line No.	Access	Programming	Possible values
1642	S	Legionella funct weekday	Monday | Tuesday | Wenesday | Thursday | Friday | Saturday | Sunday
1644	S	Legionella funct time	00:00 ... 23:50 h:m

The day-of-the-week *anti-legionella operating parameter* defines on which day the anti-legionella function must be activated. The anti-legionella function is then executed on the concerned day, whether a renewable energy is available or not.

The anti-legionella function is started up at the time which has been set. The DHW setpoint is raised to the anti-legionella setpoint which has been set, and DHW charging begins.

If no time parameter has been set, the anti-legionella function is started on the day corresponding to the first normal charging of the DHW. If no DHW load is planned on that day (continuous reduced mode), the anti-legionella function is executed at 24.00.

If DHW production is deactivated (DHW mode key = Off or Vacation), the anti-legionella function resumes as soon as it is reactivated (DHW mode key = On or end of leave).

Line No.	Access	Programming	Possible values
1645	S	Legionella funct setpoint	55 ... 95°C

The higher the temperature in the tank, the shorter the duration of the anti-legionella function.

Line No.	Access	Programming	Possible values
1646	S	Legionella funct duration	10 ... 360 min

The *anti-legionella setpoint* must not be interrupted during the set holding time . If the tank temperature measured (by the coldest sensor, when two sensors are used) is greater than the *anti-legionella setpoint* less 1 K, the *anti-legionella function* is considered to be accomplished and the*holding time* begins.

If the tank temperature measured before the end of the *holding time* is less by more than a differential of + 2 K with respect to the *anti-legionella setpoint* , the *holding time* must be renewed. If no *setpoint holding time* is set, the *anti-legionella function* is considered to be accomplished as soon as the anti-legionella setpoint is achieved.

Line No.	Access	Programming	Possible values
1647	S	Legionella funct circ pump	Off | On

The loop pump Q4 can be activated during the anti-legionella function .

8.3. Loop pump Q4

The pump is controlled by a multifunction relay configured accordingly.

Line No.	Access	Programming	Possible values
1660	S	Circulating pump release	Time program 3 / HCP | DHW release | Time program 4 / DHW | Time program 5

The “DHW release” setting starts up the loop pump when DHW production is released.

Line No.	Access	Programming	Possible values
1661	S	Circulating pump cycling	Off | On

To limit losses during circulation, the pump can be controlled for on/off.
If the function is activated, the loop pump is activated steady for 10 minutes during the release period and disconnected again for 20 minutes.

INFORMATION: If the pump is activated as part of an anti-legionella cycle, it is no longer controlled cyclically. If the function is deactivated, the pump remains activated continuously during the release period.

Line No.	Access	Programming	Possible values
1663	S	Circulation setpoint	8 ... 80 °C

If a sensor is installed in the DHW distribution line, the regulator monitors the temperature measured during execution of the anti-legionella function. The setpoint set must be maintained on the sensor throughout the duration *of the anti-legionella function* programmed. Adjustment of the maximum circulation value is limited to the nominal setpoint.

8.4. Mode switching

Line No.	Access	Programming	Possible values
1680	S	Optg mode changeover	None | Off | On

In the event of external switching by input Hx, it is necessary to first define the mode to which the switchover will take place.

9. “CONSUMER CIRCUITS” PARAMETERS

The boiler controller can respond to external consumer requests.

The external consumers send their temperature request either by a 0...10 V signal configured at input H1, or by a dry contact (on H1) and a predefined setpoint configured in the boiler controller.

To display the consumer circuit menu in the program, you must first configure input H1 with one of the 2 functions described below.

The consumer circuit pumps can be controlled by defining a boiler controller output (QX2 to be defined in Q15).

A pool circuit is considered as an external consumer. The pool menu and the associated functions appear on the program when an input BX is declared as pool sensor (B13) and the sensor is connected. You can also define a pool pump (Q19).

9.1. Outlet setpoint

Line No.			Access	Programming	Possible values
VK1	VK2	VK3			
1859	1909	1959	C	Flow temp setp cons request	8 ... 120 °C

Here, you set the outlet setpoint to be taken into account in the event of a consumer circuit request.

9.2. Override signal / blocking signal

Line No.			Access	Programming	Possible values
VK1	VK2	VK3			
1875	1925	1975	S	Excess heat draw	Off | On

If evacuation of the surplus heat is activated, the surplus of energy can be evacuated by consumer take-off. This can be adjusted separately for each consumer circuit.

9.3. Storage tank / primary regulator

Line No.			Access	Programming	Possible values
VK1	VK2	VK3			
1878	1928	1978	S	With buffer	No | Yes

If a storage tank is used, you must specify here if the consumer circuit can be supplied from the storage tank. The boiler storage tank temperature serves as criterion for possible release of additional alternative sources of energy.

Line No.			Access	Programming	Possible values
VK1	VK2	VK3			
1880	1930	1980	S	With prim contr/system pump	No | Yes

You can specify if the consumer circuit is supplied from the primary regulator or by the primary pump (depending on installation).

10. “POOL” PARAMETERS

Access to the pool function parameters is only possible when a consumer circuit is declared as pool circuit.

10.1. Heating setpoint

Line No.	Access	Programming	Possible values
2055	S	Setpoint solar heating	8 ... 80 °C
2056	S	Setpoint source heating	8 ... 80 °C

When the pool is heated by the solar function, the setpoint is defined by parameter 2055, otherwise it is defined by parameter 2056.

10.2. Load priority

Line No.	Access	Programming	Possible values
2065	S	Charging priority solar	Priority 1 ... Priority 3

Priority 1
The pool has priority.

Priority 2
The DHW has priority over the pool.

Priority 3
No priority (after DHW, heating circuits and consumer circuits).

10.3. Solar integration

Line No.	Access	Programming	Possible values
2080	S	With solar integration	No | Yes

Here you must specify if the pool can be heated with a solar solution.

11. « BOILER » PARAMETERS

The boiler receives heat requests and regulates its power in accordance with the needs.

Optimisation functions can be used to limit the number of cycles.

The boiler controller is the regulator which calculates the boiler flow setpoint in accordance with the various heat requests. These requests can come from several callers :

- Heating circuits controlled by boiler controller
- DHW circuit controlled by boiler controller
- Request from consumers not controlled by the boiler controller by On/Off contact or 0...10 signal.
- External request on LPB bus

CAUTION: **The boiler has an appropriate factory configuration. Configuration changes must be performed with caution to respond to specific application needs.**

11.1. Operating mode

Line No.	Access	Programming	Possible values
2203	S	Release below outside temp	-50 ... 50 °C

The boiler is only set into service provided the temperature is below the parameter value.

Line No.	Access	Programming	Possible values
2208	S	Full charging buffer	Off | On

To obtain sufficient operating times, the boiler continues to operate so long as the storage tank is not entirely loaded.

11.2. Operating limits

11.2.1. Min. and max. setpoints

Line No.	Access	Programming	Possible values
2210	S	Setpoint min	8 ... 95 °C
2212	S	Setpoint max	See boiler manual

The boiler temperature setpoint which has been set can be limited by a minimum setpoint and a maximum setpoint.

These limitations will present a protection function for the boiler. Depending on the boiler mode, the minimum limitation on the boiler temperature setpoint in normal mode is the lower threshold of the boiler setpoint configured. In normal mode, the maximum boiler temperature limitation is the upper limit for the boiler setpoint which has been set and the setpoint for the electronic safety limiting thermostat.

INFORMATION: The minimum and maximum setpoint adjustment range is limited by the manual mode setpoint.

11.2.2. Manual mode

Line No.	Access	Programming	Possible values
2214	E	Setpoint manual control	(setpoint min) ... (setpoint max)

In manual mode, the common starting setpoint can be adjusted to a fixed value.

11.2.3. Frost protection setpoint

Line No.	Access	Programming	Possible values
2217	S	Setpoint frost protection	-20 ... 20 °C

Frost protection of the boiler is ensured independently of the heat requests or of the components connected. This function initiates, as may be necessary, activation of the burner. In this case, the consumer circuits are switched in order to take the heat generated.

11.2.4. Minimum return setpoint

Line No.	Access	Programming	Possible values
2270	S	Return setpoint min	See boiler manual

The minimum return setpoint is configurable. If the boiler return temperature is below the return setpoint, the return temperature holding function is activated.

11.3. Optimisation

11.3.1. Burner control

Line No.	Access	Programming	Possible values
2243	S	Burner off time min	0 ... 20 min

The minimum pause time of the boiler acts exclusively between the successive heat requests. The boiler is then blocked for an adjustable duration. This time is activated subsequent to regular shutdowns or activation of the safety thermostat following heat requests. The system startups requested by the on/off regulator subsequent to heating requests are only taken into account after expiry of this time period

Line No.	Access	Programming	Possible values
2245	S	SD burner off time	0 ... 80 °C

If the burner *pause differential* is exceeded the minimum pause time is interrupted

Release of minimum pause time
If the burner is activated following a heat request, the minimum pause time is released. Consequently, on the next shutdown request by the on/off regulator, it is able to start up.

Start of minimum pause time
A deactivation requested by the on/off regulator or the safety thermostat initiates the minimum pause time if it had been released beforehand.

Interruption of minimum pause time
If, during the minimum pause time, one of the following conditions occurs, it is immediately taken into account:

- DHW request
- Boiler frost protection
- regulator stop
- cleaning function

The minimum pause time continues to run in the background for heating requests.

End of minimum pause time
The heating requests cause reactivation of the burner:

- after the minimum pause time has elapsed.
- In the event of an overshoot of a configured adjustment difference (burner pause differential).

11.3.2. Timing of pumps

Line No.	Access	Programming	Possible values
2250	S	Pump overrun time	0 ... 240 min

Timed stopping of pumps following an external heating request.

Line No.	Access	Programming	Possible values
2253	S	Pump overr time after DHW	0 ... 20 min

Timed stopping of pumps after DHW

11.3.3. Burner startup time delay

Line No.	Access	Programming	Possible values
2470	C	Delay heat req special op	0 … 600 s

The time delay is used to defer startup of the burner when an actuator with a slow opening time is used.

11.3.4. Boiler power

These settings are required for cascade connection of boilers which do not have the same power levels.

Line No.	Access	Programming	Possible values
2330	S	Output nominal	0 ... 2000 kW
2331	S	Output basic stage	0 ... 2000 kW

11.4. Regulation of heating and DHW

11.4.1. Fan

Line No.	Access	Programming	Possible values
2441	S	Fan speed heating max	0 ... 10000 tr/min

This parameter is used to limit the maximum power in heating mode.

Line No.	Access	Programming	Possible values
2442	S	Fan speed full charging max	0 ... 10000 tr/min

This parameter is used to limit the maximum power in complete load mode.

Line No.	Access	Programming	Possible values
2444	S	Fan speed DHW max	0 ... 10000 tr/min

This parameter is used to limit the maximum speed of the fan for the DHW mode.
It is compatible with shutdown (HS). In the event of shutdown, the fan is controlled at its maximum speed in DHW mode.

11.4.2. Differentials

To avoid accidental cutouts during a transient phenomenon, the cutout differential is dynamically adjusted in accordance with the temperature curve. In principle, the cutout differential is reduced in accordance with the amplitude of the ringing during a transient phenomenon. In the event of non-periodic phenomena, the reduction is carried out on a time-based criterion.

Line No.		Access	Programming	Possible values
CC	DHW			
2454	2460	S	Switching diff on HCs	0 ... 20 °C

The activation threshold is calculated on the basis of the setpoint requested less the activation differential. The current parameter designates the activation differential applied in the event of a heating or DHW request.

Line No.		Access	Programming	Possible values
CC	DHW			
2455	2461	S	Switching diff off min HCs	0 ... 20 °C

The cutout threshold is calculated on the basis of the setpoint requested increased by the cutout differential. The current parameter designates the cutout differential applied in the event of a heating or DHW request.

During the transient period, the cutout differential can fluctuate between the minimum and maximum value. After the transient period has elapsed, it is always the minimum cutout differential which is used.

Line No.		Access	Programming	Possible values
CC	DHW			
2456	2462	S	Switching diff off max HCs	0 ... 20 °C

The cutout threshold is calculated on the basis of the setpoint requested increased by the cutout differential. The current parameter designates the cutout differential applied in the event of a heating or DHW request.

The maximum cutout differential is only used during the transient period.

Line No.		Access	Programming	Possible values
CC	DHW			
2457	2463	S	Settling time HCs	0 ... 240 min

This parameter defines the time during which, following initiation of the burner, the cutout threshold can be calculated using the maximum cutout differential.

This parameter applies to heating and DHW requests.

12. « CASCADE » PARAMETERS

For a cascade, a network must be created on the LPB bus (with OCI345) comprising at least two boilers.

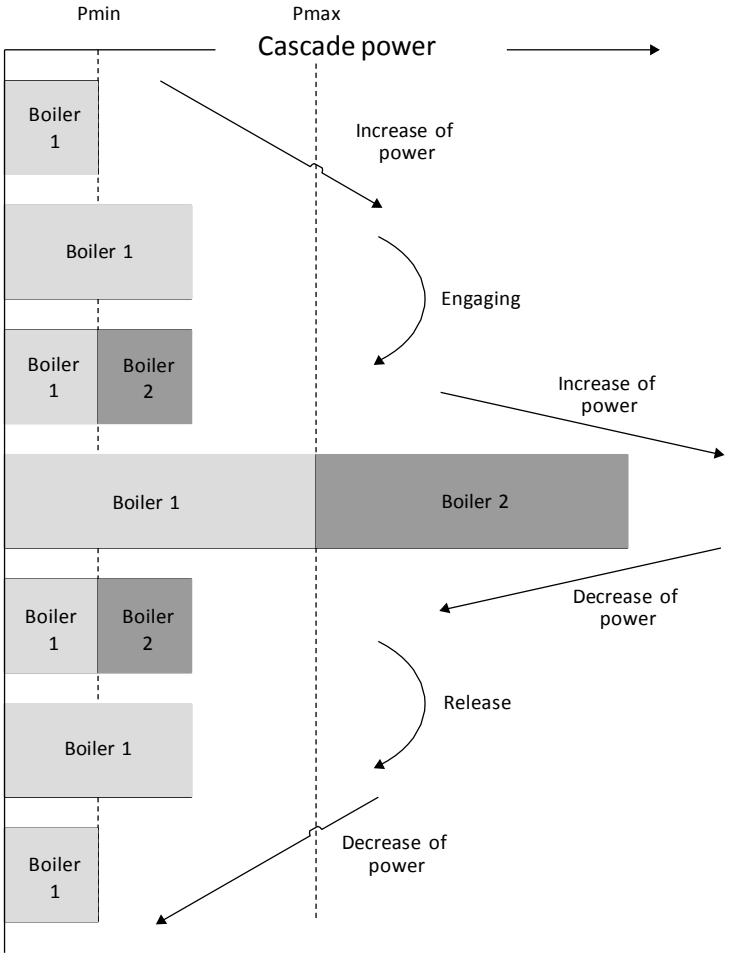
The NAVISTEM B3000 can be master or slave on the bus. The cascade can comprise an NAVISTEM B3000, LMU and RVS.

The bus always has a master (address 1) and one or several slaves defined with different addresses (addresses from 2 to 16)

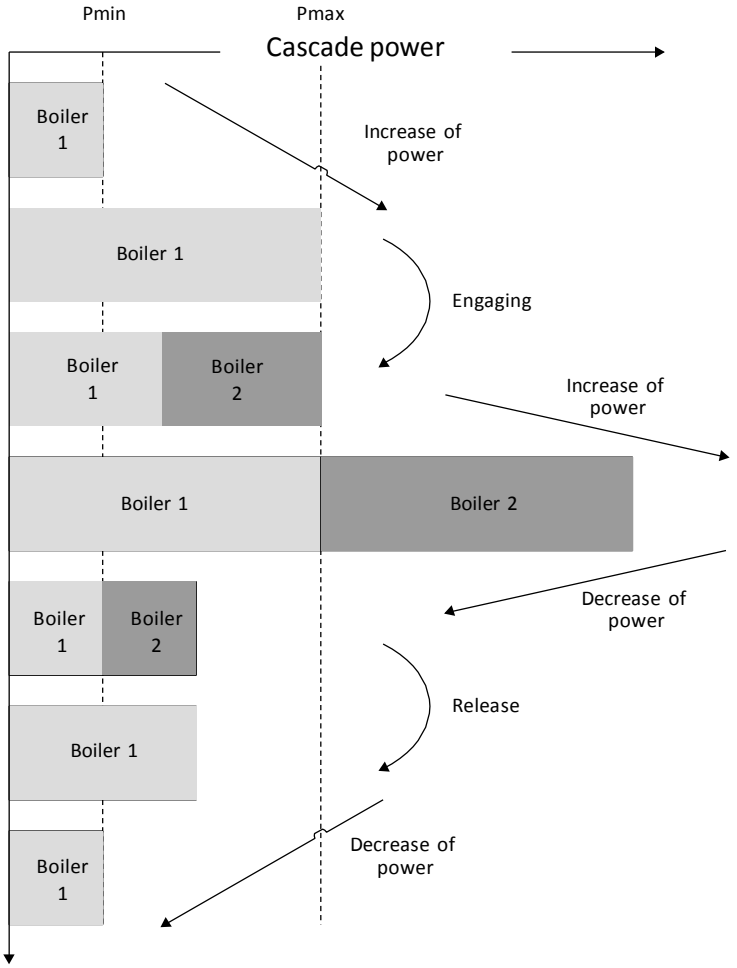
A cascade flow temperature sensor on an input Bx (configured as common flow sensor b10) must be configured on the cascade master. A cascade return sensor B70 can be configured for certain applications.

Select a cascade strategy :

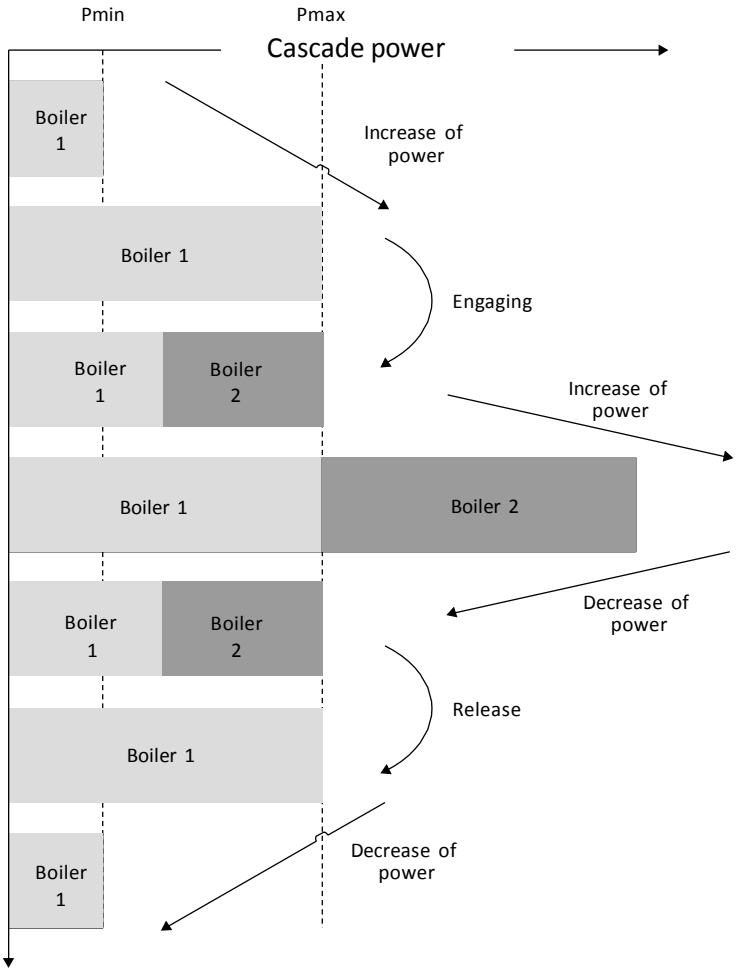
Activation delayed, stopping anticipated



Activation delayed, stopping delayed



Activation anticipated, stopping delayed



Adjust the power ranges to control the switchovers in the cascade strategies described above. The ranges are common to all the boiler switchovers, these ranges must therefore be adjusted in accordance with the type of boiler in the cascade.

Depending on the energy performance level of the boilers forming the cascade, priorities should be given. Use the boiler providing the highest efficiency (example, VARMAX) most often and use the least efficient boiler as little as possible or as backup (example, pressurised boiler).

12.1. Operating mode

Line No.	Access	Programming	Possible values
3510	S	Lead strategy	Late on, early off |Late on, late off | Early on, late off
3511	S	Output band min	0 ... 100 %
3512	S	Output band max	0 ... 100 %

Keeping in mind the recommended power range, the generators are activated or deactivated in accordance with the cascade control strategy set.
To deactivate the power range action, set the limit values to 0% and 100% and the control strategy to delayed activation, delayed stop.

12.2. Regulation

Line No.	Access	Programming	Possible values
3530	S	Release integral source seq	0 ... 500 °Cmin

When the energy request exceeds the release integral amount set here, a second boiler is activated. By increasing the value of the parameter, activation of the additional generators is slowed down. By decreasing the value of the parameter, activation of the additional generators is accelerated.

Line No.	Access	Programming	Possible values
3531	S	Reset integral source seq	0 ... 500 °Cmin

If a heat generator currently in service exceeds the energy requirement of the cutout integral set here, the generator with the highest priority is cut off. By increasing this value, the generators stay activated longer (in the event of surplus heat). By decreasing the value of the parameter, stopping of the generators is accelerated.

Line No.	Access	Programming	Possible values
3532	S	Restart lock	0 ... 1800 s
3533	S	Switch on delay	0 ... 120 min

Reactivation lock
The reactivation time delay prevents newly starting a boiler which has just been stopped. It is only at the end of this set time delay that it is again released. This prevents over-frequent starting and stopping of the generators while ensuring stable operation of the installation.

Activation time delay
Correct adjustment of the time delay ensures stable operation of the installation. It prevents over-frequent starting and stopping of the generators.
For the DHW demand, the timeout is defined for 1 min.

Line No.	Access	Programming	Possible values
3534	S	Forced time basic stage	0 ... 1200 s

Each boiler is then activated at the basic rate during the time defined.
It is only at the end of this period that the next rate is released.

12.3. Boiler sequence

Line No.	Access	Programming	Possible values
3540	S	Auto source seq ch'over	10 ... 990 h

The boiler sequence is automatically switched to manage the load of the boilers forming a cascade by defining the order of the control boiler and the backup boilers.

Fixed order
The - - - setting defines a fixed switching order. The control boiler can be defined at line 3544; the other boilers are activated in the order consistent with their LPB device addresses.

Switching order according to operating time
At the end of the hours configured, the order of the boilers forming the cascade is inverted. The boiler with the next higher address takes charge of the main boiler function.

Line No.	Access	Programming	Possible values
3541	S	Auto source seq exclusion	none | first | last |first and last

The exclusion setting can only be used in association with the sequence activated at line 3540.
Boiler exclusion is used so that neither the first and/or the last boiler is used when the automatic switchover takes place.

None

The order of activation of the boilers is inverted at the end of the hours configured (line 3540).

First
The boiler with the lowest address continues to be the main boiler. The following ones switch their activation order after the number of hours specified in line 3540.

Last
The boiler with the highest address (last address) is always the last in the sequence. For the other boilers, the order of activation is inverted after the configured hours have elapsed (line 3540).

First and last
The boiler with the lowest address (first address) continues to be the main boiler. The boiler with the highest address (last address) is always the last in the sequence. The boilers with the intermediate addresses are switched over following the number of hours set (line 3540).

Line No.	Access	Programming	Possible values
3544	S	Leading source	source 1 | ... | source 16

The main boiler setting is only used in association with the fixed order of the boiler sequence on line 3540.
The main boiler defined will always be activated first and deactivated last. The other boilers are switched in the order of their device addresses.

12.4. Return temperature min. limitation.

Line No.	Access	Programming	Possible values
3560	S	Return setpoint min	8 ... 95 °C

As soon as the return temperature exceeds the return setpoint adjusted, the return temperature holding function is activated. The return temperature holding function is used to influence the consumers or to use a return regulator.

Line No.	Access	Programming	Possible values
3562	S	Return influence consumers	Off | On

If the return temperature of the released boiler cascade drops below the minimum temperature set, the regulator calculates a blocking signal.

If this signal is greater than the corresponding limit value, the consumer pumps are or remain stopped in the pump circuits (circulating pump, DHW pump, external charging). In those circuits with mixing valve, the flow setpoint is reduced in accordance with the value of the blocking signal.

13. "DHW TANK" PARAMETERS

13.1. Load regulation

Line No.	Access	Programming	Possible values
5020	S	Flow setpoint boost	0 ... 30 °C

The DHW request to the generator comprises the current DHW setpoint and the adjustable boost.

Line No.	Access	Programming	Possible values
5021	S	Transfer boost	0 ... 30 °C

The transfer is used to route the buffer tank energy to the DHW tank. In this respect, the current temperature of the buffer tank must be greater than the current temperature in the DHW tank. This differential can be set here.

Line No.	Access	Programming	Possible values
5022	S	Type of charging	Recharging | Full charging | Full charging legio | Full charg 1st time day | Full charg 1st time legio

The tank can be loaded with up to two sensors max. A partial load can also be combined using a sensor and an anti-legionella function based on 2 sensors (setting 3).

Recharging
The DHW request is controlled by sensor B3.

Complete load
The DHW request is controlled by the two tank sensors B3 and B31.

Anti-legionella complete load
If the anti-legionella function is active, the DHW request is controlled by the two tank sensors B3 and B31, otherwise by sensor B3.

Complete load, first of the day
On the first daily load, the DHW request is controlled by the two tank sensors B3 and B31 ; the following charging operations by sensor B3 only.

Complete load, anti-legionella + 1st of the day
On the first daily load, and when the anti-legionella function is active, the DHW request is controlled by the two tank sensors B3 and B31 ; in the other cases, by sensor B3 only.

13.2. Protection against overheating

Line No.	Access	Programming	Possible values
5050	S	Charging temp max	8 ... 95 °C

This function is activated when a solar system is integrated.
The DHW tank is loaded by the solar energy to the maximum DHW load value which has been set.

13.3. DHW tank frost protection

If the temperature drops below 5 °C, the boiler is activated to bring the temperature up to 10 °C.

13.4. Adiabatic cooling

Line No.	Access	Programming	Possible values
5055	S	Recooling temp	8 ... 95 °C
5056	S	Recooling heat gen/HCs	Off | On
5057	S	Recooling collector	Off | Summer | Always

There are two functions for adiabatic cooling of the DHW tank.
An adiabatic cooling function remains active so long as the tank has not reached the adiabatic cooling temperature.
The energy can be discharged in the heating circuits or be transferred to the surroundings by the manifold surface when it is cold.

13.5. Electrical immersion heater

Line No.	Access	Programming	Possible values
5060	S	El imm heater optg mode	Substitute | Summer | Always
5061	S	El immersion heater release	24h/day | DHW release | Time program 4/DHW
5062	S	El immersion heater control	External thermostat | DHW sensor

INFORMATION:

The DHW mode selection key also acts on the heating unit. For DHW loading to take place, the DHW key must be activated.

Effective release only occurs when the electrical resistor can operate consistently with the *"Electrical resistor" mode* setting (5060).

For the setpoint value compensation to operate correctly, the thermostat external to the regulator must be set to the maximum tank temperature.

13.6. Evacuation of surplus heat

Line No.	Access	Programming	Possible values
5085	S	Excess heat draw	Off | On

The following functions can trigger evacuation of the surplus heat :

- Inputs H1, H2, H3 or EX2
- Adiabatic cooling of tank
- Evacuation of surplus heat from solid fuel boiler

If evacuation of surplus heat is activated, the surplus energy can be evacuated by the room heating system. This can be adjusted separately for each heating circuit.

13.7. Installation hydraulic system

Line No.	Access	Programming	Possible values
5090	S	With buffer	No | Yes

If a buffer tank is used, you must specify here if the DHW tank is supplied from the buffer tank. The boiler buffer tank temperature serves as criterion for release of the additional energy sources when these are taken into account.

Line No.	Access	Programming	Possible values
5092	S	With prim contr/system pump	No | Yes

You can specify if the DHW tank is supplied from the pre-regulator or with the network pump (depending on installation).

Line No.	Access	Programming	Possible values
5093	S	With solar integration	No | Yes

You can specify if the DHW tank must be supplied by the solar energy system.

13.8. Speed-controlled pump

Line No.	Access	Programming	Possible values
5101	S	Pump speed min	0 ... 100 %
5102	S	Pump speed max	0 ... 100 %

The range of speeds for control of the charging pump is limited by the minimum and maximum speeds authorised. To ensure correct operation of the pump, the speed is taken to its maximum for 10 seconds when the pump is started up.

14. « CONFIGURATION » PARAMETERS

The boiler controller must be suitably configured to adapt to the heating system needs.

It has 3 configurable relay outputs (QX1, QX2 and QX3), 2 configurable sensor inputs (BX2 and BX3), a 0...10 V or On/Off input (H1) and a second On/Off input (H5, dry contact).

In its factory configuration, output QX1 is configured as Boiler pump Q1. Output QX2 is configured as DHW pump Q3. Output QX3 is configured as shut off valve Q1. The other inputs/outputs must be configured according to needs.

Boiler controller inputs/outputs	Factory configuration	Possible configuration
QX1	Boiler pump Q1	
QX2	DHW pump Q3	DHW pump Q3, or consumer circuit pump Q15, or direct circuit pump.
QX3	Shut-off valve Q1.	
BX2	-	Cascade flow sensor B10 or FGT sensor
BX3	-	Cascade return sensor B70.
H1	0-10v	Request, consumer circuit 1 or 2 (10V), or request, consumer circuit 1 or 2 (On/Off).
H5	Remote On/Off	

Be sure to correctly configure the boiler controller inputs/outputs to adapt to the heating system.

You can check that the boiler controller is properly configured by checking the hydraulic diagram which the boiler controller has detected.

EXTENSION MODULES

The extension modules bring additional inputs / outputs to the boiler controller.

These must be configured mechanically (jumper) to define the module number (from 1 to 3) and by software (MMI) to define the functionality ensured.

These can be either self-configured in accordance with 6 predefined functions (heating circuit 1, heating circuit 2, heating circuit 3, return temperature regulation, solar DHW, pre-regulation) or each input / output of an extension module can be defined for a specific function.

14.1. Hydraulic configuration

14.1.1. Presetting

CAUTION: **We do not recommend that you choose a presetting. The entire configuration is indicated in the boiler manual.**

Line No.	Access	Programming	Possible values
5700	C	Presetting	1 ... 4

Four configurations have been preset on the boiler controller to configure all the parameters of a typical installation.

14.1.2. Heating and cooling circuits.

Line No.			Access	Programming	Possible values
CC1	CC2	CC3			
5710	5715	5721	C	Heating circuit 1, 2, 3	Off | On

The heating circuits can be activated and deactivated by this setting.

Line No.	Access	Programming	Possible values
5711	C	Cooling circuit 1	Off | 4-pipe system cooling

Parameter not used in our configuration.

14.1.3. DHW tank

Line No.	Access	Programming	Possible values
5730	C	DHW sensor	DHW sensor B3 | Thermostat | DHW outlet sensor B38

This parameter is used to specify the sensor connected to input B3/B38.

DHW Sensor B3
There is a DHW sensor. The regulator calculates the switching points with the corresponding differential using the DHW setpoint and the temperature measured in the DHW tank.

Thermostat
Regulation of the DHW temperature is based on the switching state of a thermostat connected to the DHW sensor B3.

DHW outlet sensor B38

There is a sensor on the instantaneous hot water outlet. The regulator calculates the switching points with the corresponding differential using the water heating setpoint and the DHW temperature measured at the outlet.

Line No.	Access	Programming	Possible values
5731	C	DHW controlling element	No charging request | Charging pump | Diverting valve

The DHW load can be carried out with the charging pump or the directional valve and the heat generator pump.

INFORMATION: The DHW priority and discharge protection functions are only possible with the charging pump.

When a heating system heat request is detected, the valve always returns to the Heating position. If there is no room heating request (summer operation, ECO functions, vacation), you can specify if the valve in the DHW position must wait for the next DHW load or also return to the heating position.

None
No DHW load with DHW adjustment component Q3 / water heater adjustment component Q34.

Charging pump
The DHW is loaded with a pump.

Directional valve
The DHW is loaded with a bypass valve.

Line No.	Access	Programming	Possible values
5732	C	Pump off change div valve	0 ... 10 s

Pump deactivation time. You can set the time during which the pump is stopped while the directional valve inverts its operating mode.

In systems with a bypass valve, the pumps can be stopped on transition from heating mode to DHW mode and vice-versa. The deactivation time of the heating circuit circulators can be configured. Deactivation of these pumps can be simultaneous with startup of the directional valve or following a time delay. The number of heating circulators concerned by the cutout depends on the hydraulic system.

CAUTION: **There is no intervention on the modulation or control of the burners.**

Line No.	Access	Programming	Possible values
5733	C	Delay pump off	0 ... 10 s

Duration of pump deactivation time delay. The duration of the pump deactivation time delay can be adjusted while the directional valve inverts its operating mode.

Line No.	Access	Programming	Possible values
5734	S	Basic position DHW div valve	Last request | Heating circuit | DHW

The bypass valve adopts, by default, the position in which it finds itself in the absence of a request.

Last request
The bypass valve stays in its last position on expiry of the last request.

Heating circuit
The bypass valve (UV) goes to the heating position after the last request.

DHW
The bypass valve (UV) goes to the DHW position after the last request.

14.1.4. Separation

In installations with several boilers, a boiler can be used to load the DHW. This boiler is hydraulically uncoupled from the system and, once the charging operation is completed, indicates that it can re-join the cascade.

Line No.	Access	Programming	Possible values
5736	C	DHW separate circuit	Off | On

The DHW separation function can only be used provided a boiler cascade is available.

Off
DHW separation deactivated Each available boiler can supply the DHW tank.

On
DHW separation activated. The DHW is only loaded from the boiler configured for this purpose.

INFORMATION: For DHW separation, the DHW adjustment component Q3 must be set for *bypass valve*.

Line No.	Access	Programming	Possible values
5737	S	Optg action DHW div valve	Position on DHW | Position on heating circuit

Here, the position of the bypass valve is set when the output is active.

Position on DHW
When the output is active, the bypass valve is in the DHW position.

Position on Heating circuit
When the output is active, the bypass valve is in the heating circuit position.

Line No.	Access	Programming	Possible values
5738	S	Midposition DHW div valve	Off | On

Here, the bypass valve can be placed in the middle position to fill or drain the two heating circuits. You must then return the valve manually.

Off
The directional valve is brought to the position currently needed in accordance with the heat request and its default position.

On
The bypass valve is brought to the middle position.

14.1.5. Boiler

Line No.	Access	Programming	Possible values
5774	C	Ctrl boiler pump/DHW valve	All requests | Request HC1/ DHW only

For specific hydraulic installations, this parameter is used to specify that the boiler pump Q1 and the directional valve Q3 are only assigned to the DHW and to heating circuit 1, excluding the other circuits 2 and 3 and external consumer circuits.

All requests
The bypass valve is integrated in the hydraulic circuit for all the requests and alternates between the DHW mode and the other requests. The boiler pump is activated for all the requests.

Only request HC1/DHW
The bypass valve is only integrated in the hydraulic circuit for heating circuit 1 and the DHW, and alternates between the DHW function and heating circuit 1. All of the other requests are not hydraulically connected to the bypass valve and the boiler pump ; they are transmitted directly to the boiler.

14.1.6. Solar

Line No.	Access	Programming	Possible values
5840	C	Solar controlling element	Charging pump | Diverting valve
5841	C	External solar exchanger	Jointly | DHW storage tank | Buffer storage tank

In place of a manifold pump and bypass valves for the storage tanks, the solar installation can be operated with charging pumps.

By charging pump
With charging pumps, all the exchangers can be used at the same time. Parallel or alternating operation is possible.

Directional valve
A bypass valve only allows flow in a single exchanger. Only alternating operation is possible.

For the solar circuits with two storage tanks, it is necessary to configure the external exchanger as available and use both as DHW and storage tank, or only one of these two functions.

14.1.7. Storage tank

Line No.	Access	Programming	Possible values
5870	C	Combi storage tank	No | Yes

This setting activates the functions specific to the combined storage tanks. It is thus possible to use the electrical resistor of the tank both for heating and for the DHW.

14.2. Configuration of boiler controller inputs / outputs

14.2.1. Output, relay QX

Line number disconnect			Access	Programming	Possible values
QX1	QX2	QX3			
5890	5891	5892	C	Relay output QX1, 2, 3	None | Cons circuit pump VK1 Q15 | Boiler pump Q1 | Alarm output K10 | Heat circuit pump HC3 Q20 | Cons circuit pump VK2 Q18 | Cascade pump Q25 | Heat circuit pump HC1 Q2 | Heat circuit pump HC2 Q6 | DHW ctrl elem Q3 | Status information K36

The output settings associate the corresponding functions in accordance with the selection.
By default, relay QX1 is configured for Boiler pump Q1.

None
No function on the output by relay.

Consumer circuit pump 1 Q15
The consumer circuit pump VK1 can be used for an additional consumer. In association with an external heat request at input H with the *Consumer circuit request configuration. 1*, the application can be used, for example, for a heater battery or similar.

Boiler pump Q1
The connected pump serves to circulate the boiler water.

Output, alarm relay K10
If a fault occurs, it is indicated by the alarm relay. Closure of the contact is time-delayed by 2 minutes. When the error is eliminated, meaning that the error message is no longer present, the contact immediately opens.
Rq: If the fault cannot be eliminated for the moment, the relay can be reinitialised nonetheless. This is performed in the Faults page .

Pump CC3 Q20
The heating circuit with pump CC3 is activated.

Consumer circuit pump 2 Q18
The consumer circuit pump VK2 can be used for an additional consumer. In association with an external heat request at input H with the *Consumer circuit request configuration. 2*, the application can be used, for example, for a heater battery or similar.

Cascade pump Q25
Boiler pump common to all boilers of a cascade

Pump CC1 Q2
Heating circuit with pump CC1 activated.

Pump CC2 Q6
Heating circuit with pump CC2 activated.

DHW pump/valve Q3
Adjustment component for DHW tank

Status message K36
The output is activated when the burner is operating (flame detected).

14.2.2. Sensor input BX

Line No.		Access	Programming	Possible values
BX2	BX3			
5931	5932	C	Sensor input BX2, 3	None | Common flow sensor B10 | Cascade return sensor B70

The sensor input settings associate the corresponding functions according to the selection.

14.2.3. Inputs H1 / H5

Line No. H1	Line No. H5	Access	Programming	Possible values
5950	5977	C	Function input Hx	None | Optg mode change HCs+DHW | Optg mode changeover HCs | Optg mode changeover HC1 | Optg mode changeover HC2 | Optg mode changeover HC3 | Heat generation lock | Error/alarm message | Consumer request VK1 | Consumer request VK2 | Excess heat discharge | Consumer request VK1 10V | Consumer request VK2 10V | Pressure measurement 10V

None
No function on input.

Mode switching
- heating circuit
  The heating circuit modes are switched on the mode configured on line 900 / 1200 / 1500) by the connection terminals Hx (for example, telephone switch).
- domestic hot water
  The DHW load blocking function is only activated with the *setting "heating circuit +DHW mode switchover"* or *"DHW mode switchover".*

Generator blocked achieved
The generator is locked by the connection terminals Hx. All the temperature requests from the heating circuits and DHW are ignored. The boiler frost protection function is ensured during this time.

Error / alarm message
Input H1 generates a regulator error message. If the alarm output is configured accordingly (relay outputs QX1...3, lines 5891...5893), the error is retransmitted or indicated by an additional contact (for example, indicator light or external buzzer).

Consumer circuit request.
The flow setpoint set is activated by the terminals (for example, with a hot battery function of a hot air curtain).
The setpoint must be set on line 1859, 1909, 1959.

Evacuation of surplus heat
The surplus heat evacuation function is used, for example, by an external generator to constrain the consumers (heating circuit, DHW tank, pump Hx) to dissipate their surplus heat by an override signal. The « Evacuate excess heat » parameter is used to specify, for each consumer, acknowledgement of the override signal, and therefore participation in the surplus heat evacuation process.

Local action

With the setting "Device address LPB 0 or >1", the evacuation function only acts on the local consumers connected to the device.

Central action (LPB)

With the setting "Device address LPB = 1", the evacuation function also acts on the consumers of the other devices of the same segment. It is not possible to evacuate the surplus heat in the entire system on segments other than segment 0.

Consumer circuit request. 10V

The external load application node x receives a heat request in the form of a voltage signal (0...10V-). The linear characteristic is defined by two fixed points (voltage value 1 / function value 1 and voltage value 2 / function value 2).

10V pressure measurement

Function internal to boiler

Line No.		Ac-cess	Programming	Possible values
H1	H5			
5951	5978	C	Contact type	NC | NO

NC contact

The contact is normally closed and must be opened to activate the selected function.

NO contract

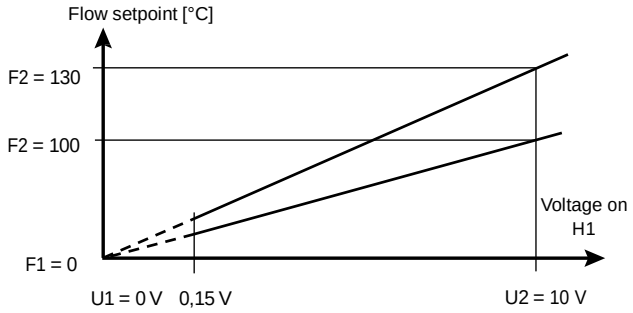
The contact is normally open and must be closed to activate the selected function.

Parameter ***Direction of action of contact Hx***	State of contact on terminal Hx	State of function / action
NO contract	open	inactive
	closed	active
NC contact	open	active
	closed	inactive

Line No.	Access	Programming	Possible values
5953	C	Voltage value 1 H1 (U1)	0 ... 10 V
5954	C	Function value 1 H1 (F1)	-1000 ... 5000
5955	C	Voltage value 2 H1 (U2)	0 ... 10 V
5956	C	Function value 2 H1 (F2)	-1000 ... 5000

The linear characteristic is defined by two fixed points. The setting is performed with two parameter binomials for « Function value » and « Voltage value »(F1/U1 and F2/U2).

Example of 10V heat request:



If the input signal goes below the 0.15 V threshold, the heat request is invalidated and therefore not operative.

14.3. Extension module configuration

Line No.			Access	Programming	Possible values
Mod. 1	Mod. 2	Mod. 3			
6020	6021	6022	C	Function extension module 1, 2, 3	None | Multifunctional | Heat circuit 1 | Heat circuit 2 | Heat circuit 3 | Return temp controller | Primary contr/system pump

By assigning a function to the extension module, the inputs / outputs are self-configured.

None
The function is inoperative.

Multifunction
The functions which can be assigned to the multifunction inputs/outputs can be viewed on lines 6030...6038 and 6040...6045.

Heating circuit 1
The settings corresponding to the « Heating circuit 1 » operator page adapt to this application.

Heating circuit 2
The settings corresponding to the « Heating circuit 2 » operator page adapt to this application.

Heating circuit 3
The settings corresponding to the « Heating circuit 3 » operator page adapt to this application.

Return temp. regulator
This function is not used. It results in a configuration error message.

Connections:

	QX21	QX22	QX23	BX21	BX22	H2
Multifunction	*	*	*	*	*	*
Heating circuit 1	Y1	Y2	Q2	B1	*	*
Heating circuit 2	Y5	Y6	Q6	B12	*	*
Heating circuit 3	Y11	Y12	Q20	B14	*	*

14.3.1. Extension module EX 1 / 2 / 3

Line No.			Access	Programming	Possible values
EX 1	EX 2	EX 3			
6024	6026	6028	C	Funct input EX21 module 1 , 2, 3	None | Limit thermostat HC

None
The input has no function

Heating circuit safety thermostat
If the extension module is used for the heating circuit, an external safety thermostat can be connected (for floor heating, for example) to input EX21 (230 V~).

14.3.2. Extension module QX 1 / 2 / 3

Line No.			Access	Programming	Possible values
QX 21	QX 22	QX 23			
6030	6031	6032	C	Relay output module 1	None | Cons circuit pump VK1 Q15 | Boiler pump Q1 | Alarm output K10 | Heat circuit pump HC3 Q20 | Cons circuit pump VK2 Q18 | Cascade pump Q25 | Heat circuit pump HC1 Q2 | Heat circuit pump HC2 Q6 | DHW ctrl elem Q3 | Status information K36
6033	6034	6035	C	Relay output module 2	
6036	6037	6038	C	Relay output module 3	

The output settings associate the corresponding functions in accordance with the selection.

INFORMATION: The outputs QX of the extension module have the same functions as those of the boiler controller. See chapter 14.2.1, page 79.

14.3.3. Extension module BX

Line No. BX 21	Line No. BX 22	Access	Programming	Possible values
6040	6041	C	Sensor input module 1	None | Common flow sensor B10 | Cascade return sensor B70
6042	6043	C	Sensor input module 2	
6044	6045	C	Sensor input module 3	

The sensor input settings associate the corresponding functions according to the selection.

INFORMATION: The inputs of sensor BX of the extension module have the same functions as those of the boiler controller. See chapter 14.2.2, page 80.

14.3.4. Extension module H2 1 / 2 / 3

Line No. module 1	Line No. module 2	Line No. module 3	Access	Programming	Possible values
6046	6054	6062	C	Function input H2	None | Optg mode change HCs+DHW | Optg mode changeover HCs | Optg mode changeover HC1 | Optg mode changeover HC2 | Optg mode changeover HC3 | Heat generation lock | Error/alarm message | Consumer request VK1 | Consumer request VK2 | Excess heat discharge | Consumer request VK1 10V | Consumer request VK2 10V | Pressure measurement 10V
6047	6055	6063	C	Contact type H2	NC | NO
6049	6057	6065	C	Voltage value 1 H2 (U1)	0 ... 10 V
6050	6058	6066	C	Function value 1 H2 (F1)	-1000 ... 5000
6051	6059	6067	C	Voltage value 2 H2 (U2)	0 ... 10 V
6052	6060	6068	C	Function value 2 H2 (F2)	-1000 ... 5000

INFORMATION: Inputs H2 of the extension modules have the same functions as those of the boiler controller. See chapter 14.2.3, page 81.

14.4. System configuration

14.4.1. Type of sensor / corrections

Line No.	Access	Programming	Possible values
6097	S	Sensor type collector	NTC | Pt 1000

If an extended temperature range is required, a Pt1000 (-28…350 °C) sensor can be used as solar panel sensor B6, rather than sensor CTN (-28…200 °C). The input of multifunction sensor BX (standard device or extension module) to which the sensor B6 is set and connected will therefore be indifferent. The corresponding input automatically uses the appropriate characteristic insofar as it is configured accordingly.

Line No.	Access	Programming	Possible values
6098	S	Readjustm collector sensor	-20 ... 20 °C
6100	S	Readjustm outside sensor	-3 ... 3 °C

14.4.2. Building and ambient temperature model

Line No.	Access	Programming	Possible values
6110	S	Time constant building	0 ... 50 h

The influence of the outdoor temperature on the ambient temperature variations is a function of the accumulative mass of the building (type of construction). This setting is used to act on the reaction speed of the flow setpoint in the event of a fluctuation of the outdoor temperature.

Example :

>20 hours

The ambient temperature reacts slowly to the outdoor temperature fluctuations.

10...20 hours

This setting can be used for most buildings.

<10 hours

The ambient temperature reacts quickly to the outdoor temperature fluctuations.

14.4.3. Setpoint control

Line No.	Access	Programming	Possible values
6116	S	Const tmps compens consig.	0 ... 14 min
6117	S	Compens centr T° consigne	1 ... 100 °C

The setpoint control function adapts the setpoint of the heat generator.
If the temperature measured at B10 is far from the line flow setpoint, the setpoint of the generators is increased. This increase can be filtered with parameter 6116 and limited by parameter 6117.

14.4.4. Frost protection

Line No.	Access	Programming	Possible values
6120	S	Frost protection plant	Off | On

Depending on the current outdoor temperature, the regulator will trigger all the enabled pumps of the installation and prevent local freezing of the heating installation. The boilers are not started up.

14.4.5. Pump / valve degumming

Line No.	Access	Programming	Possible values
6127	S	Pump/valve kick duration	0 ... 51 s

The pumps and valves are periodically activated to protect against seizure. Activation of the pumps results in circulation of water in the installation. The pump mechanical parts and the valve seat are rinsed and cleaned of suspended particles to prevent gumming

The pumps directly connected to the standard device are activated every Friday at 10 :00 hours throughout the duration of the degumming process set with an interval of 1 minute.

Degumming is only activated when there is no heat request in progress.

INFORMATION:

Degumming of the valve only takes place provided the valve has not been actuated by a regulator function since the last degumming operation.
Degumming of the pump only takes place provided the pump has not been actuated by a regulator function since the last degumming operation.

14.4.6. Register sensor

If faulty sensors are detected after installation, and to prevent them from being integrated in a correct state (which could happen in the event of automatic detection), there is a Commissioning status function.
This function learns to recognise the sensors connected and generates, in the event of a fault, an error message while inhibiting any change of installation diagram.

Line No.	Access	Programming	Possible values
6200	C	Save sensors	No | Yes

At midnight, the standard device registers the states at the sensor terminals provided the regulator has been operating for at least 2 hours. If a sensor breaks down after registration, the standard device generates an error message. This setting is used to immediately register the sensors. This may be necessary, for example, when a sensor is removed and is no longer useful.

Line No.	Access	Programming	Possible values
6205	S	Reset to default parameter	No | Yes

All the parameters can be reset to the factory settings, except the following pages :

- Date and time
- User interface
- Radio and all time schedule programs
- and the manual mode setpoint

14.5. Information

14.5.1. Installation diagram

The installation diagram can be validated by parameters 6212, 6215 and 6217.

Line No.	Access	Programming	Possible values
6212	C	Check no. heat source 1	11 : no pump 12 : with boiler pump 13 : with recycling pump 14 : with boiler and recycling pumps
6215	C	Check no. storage tank	0 : tank 4 : DHW with pump
6217	C	Check no. heating circuits	1 ... 30303

The value indicated in parameter 6217 takes the form ***xxyyzz*** where xx refers to heating circuit 3, yy refers to heating circuit 2 and zz refers to heating circuit 1.

Heating circuit	CC3 (x)	CC2 (yy)	CC1 (zz)
None	00	00	00
Direct without pump	01	01	01
Direct with pump	02	02	02
3-way valve	03	03	03

Example 1, a heating circuit (HC1 direct without pump):
actual value of parameter: 000001 value indicated: 1

Example 2, two heating circuits (HC1 direct with pump and HC2 with 3-way valve):
actual value of parameter: 000302 value indicated: 302

Example 3, three heating circuits (HC1 with 3-way valve, HC2 direct without pump HC3 direct with pump):
actual value of parameter: 020103 value indicated: 20103

Example 4, a heating circuit (HC2 direct without pump):
actual value of parameter: 000100 value indicated: 100

Line No.	Access	Programming	Possible values
6230	S	Info 1 OEM	See boiler manual
6231	S	Info 2 OEM	See boiler manual
6234	S	Boiler type	

14.5.2. Characteristics of device

Line No.	Access	Programming	Possible values
6220	S	Software version	

This information indicates the current version of the standard device

15. "LPB SYSTEM" PARAMETERS

To communicate with the other regulators, the OCI 345 enables use of the LPB bus.
This accessory is screwed onto the boiler controller platform.
The LPB bus is used either to allow the boiler to receive heat requests from other regulators having the same bus, or to create boiler cascades (cascade can be configured to optimise operation).

15.1. LPB address

Line No.	Access	Programming	Possible values
6600	C	Device address	0 ... 16
6601	S	Segment address	0 ... 14

The device address identifies each address on the bus somewhat like a postal address Each device must have a correct address to ensure communication.

15.2. Bus supply function

Line No.	Access	Programming	Possible values
6604	S	Bus power supply function	Off | Automatically

The bus power supply is a direct system supply from the regulators (no central power supply). The type of bus supply provided by the regulators is adjustable.

Off
The regulator does not supply the bus with voltage.

Automatic
The electrical power supply of the bus by the regulators is automatically switched on/off on request by the bus.

15.3. Bus power supply status

Line No.	Access	Programming	Possible values
6605	S	Bus power supply state	Off | On

The display indicates if the regulator is currently supplying the bus.

Off
Supply of the bus by the regulators is currently cut off.

On
Supply of the bus by the regulators is currently active ; the regulator is supplying current to the bus.

15.4. Centralised functions

	**CAUTION:**	**These settings only concern the device with address 1.**

Centralised « Summer » switching (LPB)

The standard device with address 1 can centralise the summer mode switching for the LPB compatible devices.

To do so, it distributes its own summer/winter heating limit status for heating circuit 1 to the other devices on the bus and forces their heating circuits to Eco mode provided they are not in Comfort mode.

	**INFORMATION:**	Only transition to the summer mode is concerned by override of the centralised switching function. If the standard master device goes back to winter mode, the other devices return to their local state, whatever it may have been, for example, before the summer mode was controlled.

The centralised function is controlled by two parameters of the standard device :

Winter/summer switchover parameter*:*

- local:
  The summer heating limit is not shared
- centralised:
  The summer heating limit is transmitted to all the heating circuits in accordance with the perimeter defined.

The action perimeter in the bus depends on the segment address and on the parameter *« Switching action perimeter »:*

- Segment address = 0 and perimeter = Segment:
  The summer switching function only acts on the standard devices in their own segment 0.
- Segment address = 0 et perimeter = System:
  The summer switching function acts on the standard devices in all the segments (0...14).
- Segment address > 0:
  The parameter is not applicable The summer switching function always acts only on the standard devices in their own segment.

	**INFORMATION:**	The « action perimeter » parameter of the switching functions also acts in sharing of the other centralised switching functions, such as the Mode switching function.

Centralised switching of mode by LPB.

The standard device with address 1 can centralise mode switching for the LPB compatible devices. The switching functions on the central standard device (by input Hx) then also act on the heating circuits and on the DHW of the other devices on the bus.

Line No.	Access	Programming	Possible values
6620	S	Action changeover functions	Segment | System

The range of the centralised switching functions can be defined.

This concerns :
Mode switching input H (provided line 6623 is set for « Centralised »")
« Summer » switching (by setting « Centralised » on line 6621)

Inputs to be implemented:

Segment
The switching function applies to all the regulators of a same segment.

System
the switching function applies to all the regulators of the system (all segments included). The regulator must be in segment 0.

Line No.	Access	Programming	Possible values
6621	S	Summer changeover	Locally | Centrally

The regulator can only apply the summer switching function to the local heating circuits, or, by LPB, to another regulator of the same segment or system.

The « summer » switching perimeter is as follows :

Local **setting**
local action; the local circuit is activated and deactivated in accordance with the settings on lines 730, 1030, 1330.

Centralised **setting**
Centralised action ; Depending on the parameter set on the « Switching perimeter » line, either the heating circuits of the segment or those of the whole system (line 730) will be activated or deactivated.

Line No.	Access	Programming	Possible values
6623	S	Optg mode changeover	Locally | Centrally

The standard device with address 1 can centralise mode switching for the LPB compatible devices.
The switching functions on the central standard device (by H1 / H2 or the heating circuit mode switching parameter) then also act on the heating circuits and on the DHW of the other devices on the bus

The effect of a centralised mode switching function depends on the device used :

For the devices **executing 1**, the heating circuits switch to *frost protection mode*.

For the devices **executing 2**, the heating circuits switch either to *frost protection mode* or *to reduced operation mode*. The mode can be determined for each circuit (parameter *"Mode switching* of heating circuit 1 = 900, HC 2 = 1200, heating circuit P = 1500").

CAUTION: **While the centralised mode switching function is active, local mode selection is inhibited on all the devices.**

The effect of mode switching by input H is as follows :

Local **setting**
Local action ; The local heating circuit is activated/deactivated

Centralised **setting**
Central action ; Depending on the parameter set on the « Switching perimeter » line, either the heating circuits of the segment or those of the entire system will be activated/ deactivated.

Line No.	Access	Programming	Possible values
6624	S	Manual source lock	Locally | Segment

The action perimeter of the boiler locking function by input H is as follows in this case :

Local **setting**
Local action The local generator is locked.

“Segment "**input**”
Central action: All the cascade generators are locked.

Line No.	Access	Programming	Possible values
6625	S	DHW assignment	Local HCs | All HCs in segment | All HCs in system

The DHW should only be assigned provided DHW production is only controlled by the heating time schedule program (see lines 1620 or 5061).

Local heating circuits
DHW production only takes place for the local heating circuit.

All the heating circuits of the segment
DHW production takes place for all the heating circuits of the segment.

All the heating circuits in the system
DHW production takes place for all the heating circuits of the system.

Whatever the setting, the regulators in « vacation » mode are also taken into account for DHW production.

Line No.	Access	Programming	Possible values
6631	S	Ext source in Eco mode	Off | On DHW | On

The energy savings mode can be selected in the "*Special mode/Service*" menu at command line 7139.

The external boilers connected to the local bus operate as follows in eco mode :

Off
Remains locked .

DHW on
Released for DHW charging.

On
Continuously released.

15.5. Clock

Line No.	Access	Programming	Possible values
6640	C	Clock mode	Autonomously | Slave without remote setting | Slave with remote setting | Master

This setting defines the action of the system time on the time set in the regulator.

Independent
The time can be set on the regulator. The regulator time is not synchronised on the system time.

Slave without adjustment
The time cannot be set on the regulator. The regulator time is continuously automatically synchronised on the system time.

Slave with adjustment
The time can be set on the regulator. It is simultaneously used as system time by the master. The regulator time is however automatically and continuously adapted to the system time.

Master
The time can be set on the regulator. The regulator time becomes the reference time for the system. The system time is synchronised.

15.6. Outdoor temperature

Line No.	Access	Programming	Possible values
6650	S	Outside temp source	0 ... 239

In the installation with LPB local bus, a single outdoor sensor only will suffice. It is connected to any regulator and supplies the temperature to the regulators which do not have an outdoor sensor. The screen first indicates the segment number, then the address of the device.

– – . – – Address of outdoor sensor cannot be read

01.02 Address of outdoor temperature sensor
The first number corresponds to the segment number (01.)
The second number corresponds to the device address (.02)

INFORMATION: If necessary (for example, if a building has different solar exposure areas), several areas of the system can be equipped with a separate outdoor sensor.

16. “ERROR” PARAMETERS

When a fault occurs, an error message can be read using the Info key. The display indicates the cause of the fault.
The boiler controller saves the last 20 faults. The system stores the fault code, the time and the operating phase during which the fault has occurred.

16.1. Information message

A fault present in the system appears on the display with the Albatros code for which the error has occurred.

Line No.	Access	Programming	Possible values
6705	E	SW diagnostic code	0 ... 65535

A fault present in the system is displayed here with the internal software diagnostic code for which the error has occurred.

Line No.	Access	Programming	Possible values
6706	E	Burn ctrl phase lockout pos	0 ... 255

A fault present in the system is displayed with the disturbance phase in which the error has occurred.

16.2. Reset

Line No.	Access	Programming	Possible values
6710	C	Reset alarm relay	No | Yes

When a fault occurs, an alarm can be triggered on relay QX. . The relay must be configured accordingly. The alarm relay can be reinitialised by this setting.

16.3. Fault indication function

Line No.	Access	Programming	Possible values
6740	S	Flow temp 1 alarm	10 ... 240 min
6741	S	Flow temp 2 alarm	10 ... 240 min
6742	S	Flow temp 3 alarm	10 ... 240 min
6745	S	DHW charging alarm	1 ... 48 h

These functions can be used to maintain the required flow temperatures. If the flow temperature deviates continuously with respect to the required level for more than the time period set, a message is generated. If, during an active alarm, the setting point is again reached, the error message is cancelled.

Line No.	Access	Programming	Possible values
6743	S	Boiler temp alarm	10 ... 240 min

This function monitors the boiler temperature when the burner is active and generates an alarm message in the event of a fault.

16.4. History

Line No.	Access	Programming	Possible values
6800, 6810, 6820, 6830, 6840, 6850, 6860, 6870, 6880, 6890, 6900, 6910, 6920, 6930, 6940, 6950, 6960, 6970, 6990	S	History ...	00:00 ... 23:59 h:m

The unit registers the last 20 faults which have occurred in a non-volatile memory. Every new input deletes the oldest input from the memory. For each error input, the system registers the code, the time, the internal software diagnostic code and the disturbance phase of the safety unit.

Line No.	Access	Programming	Possible values
6803, 6813, 6823, 6833, 6843, 6853, 6863, 6873, 6883, 6893, 6903, 6913, 6923, 6933, 6943, 6953, 6963, 6973, 6993	S	Error code ...	Error No.: error

Line No.	Access	Programming	Possible values
6805, 6815, 6825, 6835, 6845, 6855, 6865, 6875, 6885, 6895, 6905, 6915, 6925, 6935, 6945, 6955, 6965, 6975, 6995	S	Software diagnostic code ...	0 ... 9999

Line No.	Access	Programming	Possible values
6806, 6816, 6826, 6836, 6846, 6856, 6866, 6876, 6886, 6896, 6906, 6916, 6926, 6936, 6946, 6956, 6966, 6976, 6996	S	Safety unit phase ...	0 ... 255

17. “MAINTENANCE / SPECIAL MODE” PARAMETERS

17.1. Maintenance function

Line No.	Access	Programming	Possible values
7040	S	Burner hours interval	100 ... 10000 h

A maintenance message is displayed as soon as the interval set for the burner operating hours has elapsed.

Line No.	Access	Programming	Possible values
7041	S	Burn hrs since maintenance	0 ... 10000 h

Totalisation and display of current value. The value can be reset to 0 on this line.

Line No.	Access	Programming	Possible values
7042	S	Burner start interval	100 ... 65500

A maintenance message is displayed as soon as the interval set for the burner startups has elapsed.

Line No.	Access	Programming	Possible values
7043	S	Burn starts since maint	0 ... 65535

Totalisation and display of current value. The value can be reset to 0 on this line.

Line No.	Access	Programming	Possible values
7044	S	Maintenance interval	1 ... 240 months

A maintenance message is displayed when the interval set for operating time has elapsed. The burner can be turned on or off.

Line No.	Access	Programming	Possible values
7045	S	Time since maintenance	1 ... 240 months

Totalisation and display of current value. The value can be reset to 0 on this line.

Line No.	Access	Programming	Possible values
7050	S	Fan speed ionization current	0 ... 10000 rpm

Speed limits starting from which the burner ionisation current maintenance alarm must be generated when the ionisation current monitoring function controls an increase in speed due to an ionisation current which is too low.

Line No.	Access	Programming	Possible values
7051	S	Message ionization current	No | Yes

Display and reinitialisation indicator for burner ionisation current maintenance alarm for boiler controller. The maintenance alarm can only be reset provided the triggering event has been eliminated.

17.2. Cleaning

Line No.	Access	Programming	Possible values
7130	E	Chimney sweep function	Off | On
7131	E	Burner output	Partial load | Full load | Max heating load

The burner is activated. For the burner to operate as long as possible, the only active cutout point is the maximum temperature limitation of the boiler.

The burner power can be adjusted during the cleaning function:

Partial load:
Cleaning function with minimum boiler power.

Full load:
Cleaning function with maximum boiler power.

Maximum heating load:
Cleaning function with maximum heat power configured.

INFORMATION: This function is deactivated by setting -.- on this line or automatically when the maximum boiler temperature is reached.

17.3. Maintenance function

Line No.	Access	Programming	Possible values
7140	E	Manual control	Off | On

If the manual mode is active, the relay outputs are no longer controlled according to the regulation state, but are adjusted, according to their function, on a predefined state of the manual mode.
The relay outputs are switched on a state which will produce heat in accordance with their hydraulic function.

Adjustment of manual mode setpoint:
When the manual mode is activated, you must go into the main display. This is where the maintenance/special mode symbol is displayed.
By pressing on the Info key, the “Manual mode” information is displayed in which the setpoint can be defined.

If the cleaning function is activated in manual mode, the latter is interrupted to allow the function to run. The manual mode stays active so long as it is selected.

CAUTION: **This function is not monitored as a function of time. The manual mode selection remains active even after a restart.**

Line No.	Access	Programming	Possible values
7143	S	Controller stop function	Off | On

If stopping of the regulator is activated, the boiler is directly controlled to the burner power set in the regulator stopping setpoint.

Line No.	Access	Programming	Possible values
7145	S	Controller stop setpoint	0 ... 100 %

When a regulator stopping function is active, the boiler is set to the power entered here.

Line No.	Access	Programming	Possible values
7146	C	Deaeration function	Off | On

Parameter defining manual triggering of function by control key for example, or by maintenance/special mode menu . At the end of the purge operation, the parameter is reset to *Off*. It can also be set to Off to interrupt the purge operation at any time.

Line No.	Access	Programming	Possible values
7147	C	Type of venting	None | Heating circuit continuous | Heating circuit cycled | DHW continuous | DHW cycled

This parameter is used to preselect the purge phases; also refer to the previous section, ***Purge function***.
If the function is initiated, this value indicates the current phase for information.

None
Operates as parameter: By default, i.e. the purge function is active throughout phase 1 (continuous heating circuit); Phase 2 (Cyclic heating circuit); Phase 3 (continuous DHW) and Phase 4 (cyclic DHW).

Operates as information value: The function is interrupted.

Continuous heating circuit
Operates as parameter: The purge function is active throughout phase 1 (Continuous heating circuit); Phase 2 (Cyclic heating circuit); Phase 3 (continuous DHW) and Phase 4 (cyclic DHW).

Operates as information value: The function is in phase 1 (Continuous heating circuit).

Cyclic heating circuit
Operates as parameter: The purge function is only active throughout phase 2 (Continuous heating circuit); Phase 3 (continuous DHW) and Phase 4 (cyclic DHW).

Operates as information value: The function is in phase 2 (Cyclic heating circuit).

Continuous DHW
Operates as parameter: The purge function is only active throughout phase 3 (Continuous DHW) and phase 4 (cyclic DHW).

Operates as information value: The function is in phase 3 (Continuous DHW).

Cyclic DHW
Operates as parameter: The purge function is only active throughout phase 4 (cyclic DHW).

Operates as information value: The function is in phase 4 (cyclic DHW).

17.4. Service

Line No.	Access	Programming	Possible values
7170	C	Telephone customer service	0 ... 9

Entry of telephone number which appears in the information display

18. “INPUT / OUTPUT TEST” PARAMETERS

The input/output test is used to check correct operation of the connected components.

CAUTION: **The selected sensor values are updated within 5 seconds max. The display does not take account of the measured value corrections.**

INFORMATION: The relay test can be activated by a diagnostic software, and by the user interface. It remains active for 8 minutes max., after which it is forced to interrupt.

18.1. Relay output test

Line No.	Access	Programming	Possible values
7700	C	Relay test	No test | Everything off | Relay output QX1 | Relay output QX2 | Relay output QX3 | Relay output QX4 | Relay output QX21 module 1 | Relay output QX22 module 1 | Relay output QX23 module 1 | Relay output QX21 module 2 | Relay output QX22 module 2 | Relay output QX23 module 2 | Relay output QX21 module 3 | Relay output QX22 module 3 | Relay output QX23 module 3

The relay test is used to trigger and stop all of the relay outputs (burner, pumps, etc.) independently of the regulator state This is used to quickly check the wiring.
A parameter dedicated to this purpose is used to energise each relay individually. The set state remains active on exit from this parameter.
The test can be interrupted explicitly, otherwise it is automatically deactivated after 1 hour.

No test
The output test is deactivated

Everything is OFF
All the outputs are deactivated.

Relay output QX...
Only QX... is activated.

Relay output QX2... module n
Only QX2... on the extension module n is activated.

CAUTION: **The electronic temperature regulator of the boiler has priority with respect to the outputs test. It can therefore override the burner relay output test.**

18.2. Sensor inputs test.

Line No.	Access	Programming	Possible values
7730	C	Outside temp B9	-50 ... 50 °C
7750	C	DHW temp B3/B38	0 ... 140 °C
7760	C	Boiler temp B2	0 ... 140 °C
7820	C	Sensor temp BX1	-28 ... 350 °C
7821	C	Sensor temp BX2	-28 ... 350 °C
7822	C	Sensor temp BX3	-28 ... 350 °C
7823	C	Sensor temp BX4	-28 ... 350 °C
7830	C	Sensor temp BX21 module 1	-28 ... 350 °C
7831	C	Sensor temp BX22 module 1	-28 ... 350 °C
7832	C	Sensor temp BX21 module 2	-28 ... 350 °C
7833	C	Sensor temp BX22 module 2	-28 ... 350 °C
7834	C	Sensor temp BX21 module 3	-28 ... 350 °C
7835	C	Sensor temp BX22 module 3	-28 ... 350 °C

The inputs test is used to read the current measurement values on the input terminals of the units. This is used to quickly check the wiring.

18.3. Test of inputs H1 / H2 / H3 / H4 / H5 / H6 / H7

Line No.	Access	Programming	Possible values
7840	C	Voltage signal H1	0 ... 10 V
7841	C	Contact state H1	Open | Closed
7845	C	Voltage signal H2 module 1	0 ... 10 V
7846	C	Contact state H2 module 1	Open | Closed
7848	C	Voltage signal H2 module 2	0 ... 10 V
7849	C	Contact state H2 module 2	Open | Closed
7851	C	Voltage signal H2 module 3	0 ... 10 V
7852	C	Contact state H2 module 3	Open | Closed
7854	C	Voltage signal H3	0 ... 10 V
7855	C	Contact state H3	Open | Closed
7860	C	Contact state H4	Open | Closed
7862	C	Frequency H4	0 ... 2000
7865	C	Contact state H5	Open | Closed
7872	C	Contact state H6	Open | Closed
7874	C	Contact state H7	Open | Closed

The inputs test is used to read the current measurement values on the input terminals of the units. This is used to quickly check the wiring.

18.4. Test of EX inputs (extension module)

Line No.	Access	Programming	Possible values
7950	C	Input EX21 module 1	0V | 230V
7951	C	Input EX21 module 2	0V | 230V
7952	C	Input EX21 module 3	0V | 230V

The inputs test is used to read the current measurement values on the input terminals of the units. This is used to quickly check the wiring.

19. “STATE” PARAMETERS

21. “SAFETY UNIT” PARAMETERS

21.1. Operation

Line No.	Access	Programming
9524	S	Required speed LF

Rotation speed setpoint with partial load adjustable on control interface This value can only always be greater than the minimum rotation speed setpoint with partial load

Line No.	Access	Programming
9525	S	Required speed LF min

Minimum speed setpoint, partial load (safety parameter). Limit for rotation speed setpoint, *partial load*.

Line No.	Access	Programming
9529	S	Required speed HF

Rotation speed setpoint with nominal load adjustable on control interface This value can only always be greater than the maximum rotation speed setpoint with nominal load .

Line No.	Access	Programming
9530	S	Required speed HF max

Maximum speed setpoint with nominal load (safety parameter) *Limit for rotation speed setpoint with nominal load* .

21.2. Chimney drying function

Line No.	Access	Programming
9650	S	Chimney drying

If the chimney drying function is activated, the function starts after a shutdown on transition to reduced mode. The chimney drying function can be interrupted by any heat request, and restarts when the system returns to standby.

Off
The function is inoperative.

Temporary
Duration of chimney drying in accordance with *”Chimney drying duration”* parameter, line (9652).

Continuous
The chimney drying function is continuously executed in standby mode

Line No.	Access	Programming
9651	S	Req speed chimney drying

Speed at which chimney drying must be executed.

Line No.	Access	Programming
9652	S	Duration chimney drying

Duration of chimney drying when execution must be limited in time.
