

# Cloudforce One

## Threat intelligence and operations

### Get unmatched threat visibility and expertise

Threat intelligence is critical for organizations to stay ahead of emerging risks, but today's teams often find themselves overwhelmed and under-resourced.

Cloudforce One leverages Cloudflare's global threat visibility to provide a powerful package of threat intelligence and expertise to make your organization smarter, more responsive, and more secure.

### Threat intelligence built for action

Cloudforce One helps investigate, respond to, and reduce threats faster by providing:

- **Real-time access to global threat activity.** Access curated threat data from Cloudflare's global network, including domains, IPs, phishing infrastructure, and DNS records, each mapped to attacker TTPs.
- **Tailored threat research.** Submit custom RFIs to Cloudforce One threat analysts for structured reporting on attackers, infrastructure, malware, and more.
- **Built-in operational tools.** Investigate indicators, monitor brand abuse, and take action directly within the Cloudflare Dashboard to mitigate threats.

#### Threat data at massive scale

~20% of the Internet runs on Cloudflare, granting unique visibility into trillions of threat activity signals and enabling you to identify attacks at the earliest stages of conception.

#### Proven threat expertise

Cloudforce One analysts bring deep experience in malware analysis, infrastructure tracking, and disruption of nation-state and cybercrime groups.

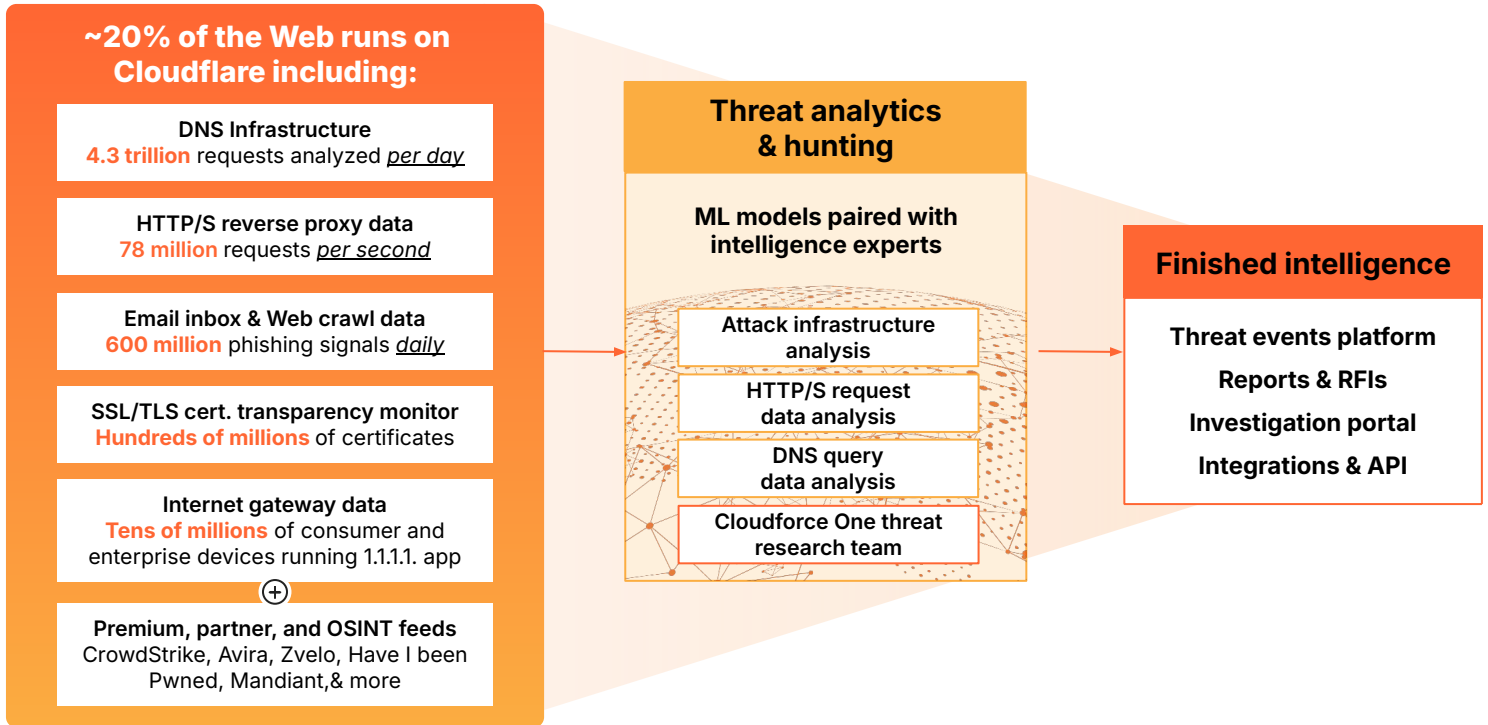

#### Turn insights to action

Intelligence is natively built into Cloudflare's security solutions. It is provided via API-driven threat feeds that integrate with existing SOC workflows and security products.

# Threat data, analysis, and dissemination

## Data sources

## Threat events platform

Cloudforce One translates high-volume attack data observed on the Cloudflare network into real-time, attacker-attributed events relevant to your organization.

- **Track adversary activity at scale** — including APT infrastructure, cybercrime groups, compromised devices, and volumetric DDoS activity.
- **Review detailed, context-rich events** — including interactive timelines and detailed events mapped to attacker TTPs, regions, and targeted verticals.
- **Operationalize faster** — with enriched IoCs, attacker associations, and exportable data to feed your workflows and tooling.
