How to Stay Connected in an Evolving Healthcare Landscape

In the fast and ever-changing world of medical research, connectivity is everything. You need to remain connected and in control of your data SIMs, wherever your clinical trials are taking place. Of course, this can be easier said than done.

Medical professionals and patients require a solution that will adapt to their needs, offering centrally managed IoT connectivity, controlled security, and cost-efficient IoT SIM card management. This is only possible through a data SIM management console that lets you view and manage all your IoT SIM cards globally via a single, easy-to-use platform.

For medical research teams, the HMD Connect Pro console offers a simple way to stay on top of all your connected IoT devices while keeping connections and costs under control.

As the medical landscape continues to evolve and medical trials can stop and start, it helps to know you can find a data package that will adapt to your most pressing clinical needs.

Hassle-free data SIM for busy medical professionals

Simplified data SIM management is a vital first step for medical health workers seeking operational efficiencies, so they can better focus on medical research outcomes and patient care.
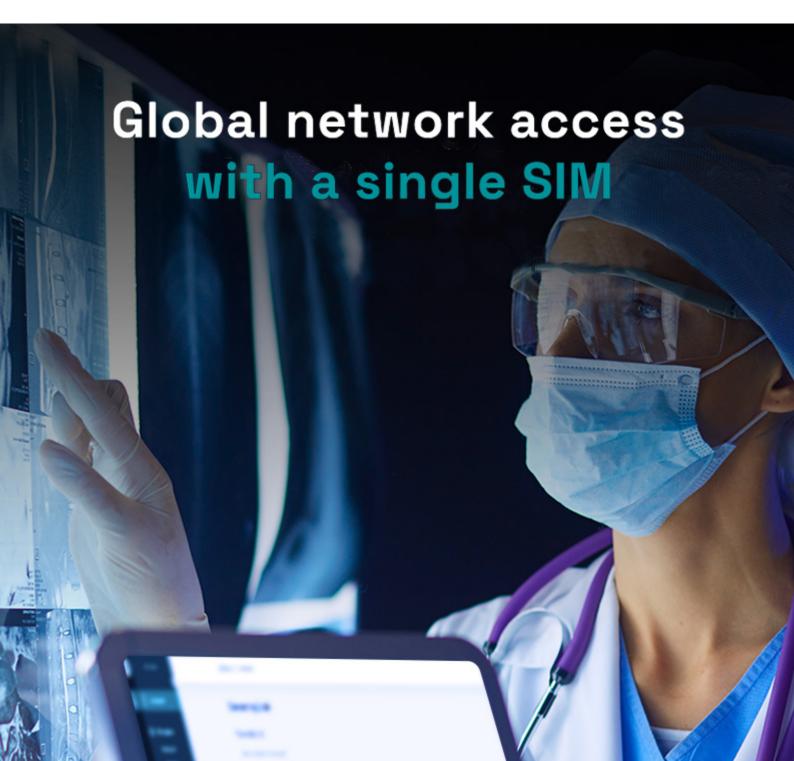

In this space, the HMD Connect Pro console can offer a solution for your needs. The simple to use, straightforward management console lets you view and manage all your SIM cards for your medical research teams, wherever they are in the world.

With global connectivity offered across 180 countries and 600 networks, managing 50 to 50,000 SIMs is easy. Clinical teams with existing devices also benefit from easy integration with legacy infrastructure, as well as a multi-operator SIM that ensures your staff are always using the best network for their needs.

In clinical trials especially, things can change at a moment's notice, which is why it's important to maintain real-time access of your global fleet of SIMs for complete visibility. The HMD Connect Pro console keeps you in full control, with the ability to oversee all your IoT SIMs deployed worldwide, group SIMs, view session data, and filter users in real-time.

Plus, a user-friendly interface is a must to limit the training required for busy healthcare professionals and research staff with varying technical competence. Every minute that's saved on having to train new users on how to use a new system is time that can be redirected into what matters most – optimising clinical trial outcomes and improving patient care.

Secure patient data means less stress

Paper-based processes pose a particular challenge in medical trials, since unstructured information is unsecured and not readily accessible to teams working in global and remote locations. In addition to finding an IoT connectivity solution you can trust, it's important to use a data SIM management platform with security features to help protect sensitive patient information.

Wherever your medical research takes you, the HMD Connect Pro console offers secure SIM data connectivity. Based in Europe, HMD Global complies with strict data protection and privacy laws. And our EU-based servers mean your data will be routed securely in mobile network, so you don't have to use suspicious Wi-Fi networks.

We understand that sometimes patients may need to log data from remote locations. But with our cost-effective data SIMs, your teams will have no need to use unsecure Wi-Fi hotspots – they will remain seamlessly and safely connected wherever they are in the world.

In critical environments when things change the implications can be business critical. Of course, medical staff and patients may come and go, but this cannot compromise the security of the data managed. That's why we make it possible to activate and de-activate SIM cards from the management console at any given time.

Controlled security Streamlined information for a more complete patient picture

Managing patient data efficiently is essential for successful healthcare operations. To achieve this, medical research staff require full visibility over their entire fleet of data SIMs with a simple user interface that reduces clinician and staff training time.

Having all this information within easy access enables clinicians to spend less time searching for information and more time engaged with patients.

The HMD Connect Pro console is designed to help support clinical processes in the most demanding environments. Offering a single platform from which to view all your SIM data, medical teams always know what's happening.

Easy-to-use and streamlined solutions such as these are game changers for health-care professionals. By keeping medical staff and patients connected, we provide you the visibility and control you need to make informed decisions and achieve the best research outcomes.
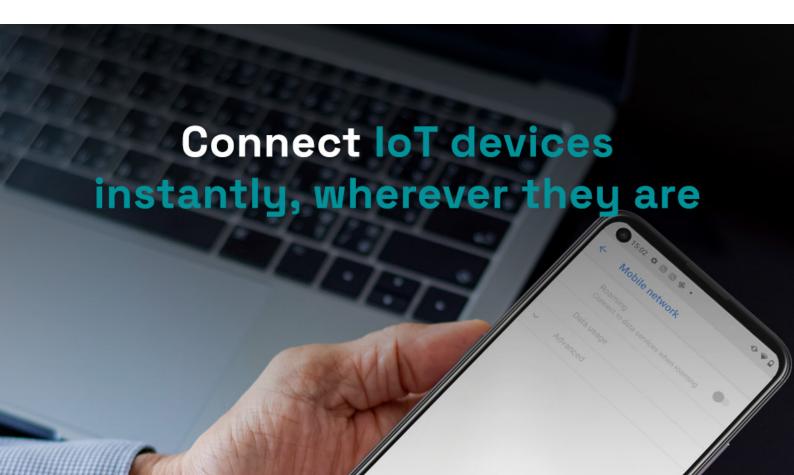

Plus, customisation features can ensure you only see what you need to see when you need to see it, so you can stay focused on life-saving research.

Plans that adapt to your timelines and budget

Every day, medical trials are happening across the world under tight timelines and immovable budgets. In this environment, medical research staff require data SIM plans that are flexible and cost-effective.

The HMD Connect Pro console makes it easy to manage your data at a price that suits your needs. Our easy, transparent pricing starts low and with pay-as-you-go upgrade options, you only end up paying for the data you use.

This flexibility is ideal for medical trials of varying lengths, budgets and locations, giving you full control to extend your connection period or cancel at any time. In addition, the HMD Connect Pro console makes it easy to manage all costs and billing from one place, so you get a real-time glimpse of session data and data usage from anywhere and can stay in charge of your costs and connections.
