	<b>1</b> /	Tiol	$\sim 11$	ral	avant	hava	_

I have ex	plained th	e course	of treatmen	t and in	itended l	benefit to	the	patient.

#### **The intended benefits** (there are no guarantees about outcome)

☐ Curative – to give you the best possible chance of being cured.
☐ Disease control or palliative – the aim is not to cure, but to control or shrink the disease and improve
both quality of life and survival.

Adjuvant – therapy given after surgery or radiotherapy to reduce the risk of the cancer coming back.

Neo-adjuvant – therapy given before surgery or radiotherapy to shrink the cancer, allow treatment and reduce the risk of the cancer coming back

## Statement of health professional

Patient identifier/label

You may have one or more of the side effects listed

Common side effects:	Occasional side effects continued:			
Affecting more than 10 in every 100 (>10%) people	Temozolomide can raise your blood sugar levels.			
An increased risk of getting an infection from a drop in white blood cells – it is harder to fight infections and you can become very ill.  If you have a severe infection this can be lifethreatening. Contact your doctor or hospital straight away if:  • your temperature goes over 37.5°C or over 38°C, depending on the advice given by your chemotherapy team  • you suddenly feel unwell (even with a normal temperature)  Tiredness and feeling weak (fatigue).  Feeling sick (nausea), being sick (vomiting), diarrhoea, constipation.  Sore mouth and ulcers, tummy pain, taste changes, loss of appetite, weight loss.  Soreness, redness, peeling on palms of the hands and soles of the feet, skin itch, dryness, redness, colour change, hair thinning or loss.  Headaches, fits (seizures), weakness on one side of the body, difficulty speaking, writing, understanding.  High blood pressure.  Anaemia (due to low red blood cells), bleeding or bruising (due to low platelets).	Other risks:  Cancer and its treatment can increase your risk of developing a blood clot (thrombosis) that may cause pain, redness, swelling in an arm or leg, breathlessness, chest pain, a stroke. Tell your doctor straight away if you have any symptoms.  Before treatment, you might have blood tests to check for viruses (Hepatitis B, Hepatitis C, HIV or more unusual infections). This treatment may weaken your natural defence (immune) system, so infections like this could worsen or become active again if you've had them in the past. You may have medicines to prevent or treat infection.  Temozolomide can cause liver damage (which is uncommon, but can be serious), or liver inflammation (by activating Hepatitis B Virus, if you've had this before). Tell your doctor if you have yellowing of the eyes or skin (jaundice), appetite loss, feeling or being sick, pain in the right side of the tummy, tiredness, dark urine.  Capecitabine can rarely cause heart problems (chest pain, irregular heart rate, heart attack).  Increased risk of a second cancer (years later).  Potentially life-threatening side effects if your genetic make-up means you cannot break down Capecitabine properly (DPD deficiency). Contact your hospital straight away if you get even minor			
Occasional side effects:  Affecting between 1-10 in every 100 (1-10%) people  Dry mouth, difficulty swallowing, indigestion, passing wind, weight loss.  Numbness, tingling, loss of sensation in hands or feet, muscle or joint pain, muscle weakness, loss of balance, shaking.  Allergic reactions, breathlessness, cough, coughing up blood.  Build-up of fluid in the hands and feet.  Increased need to pass urine, incontinence.  Changes in eyesight (watery or pink eyes), hearing changes (problems with hearing, ringing in the ears, pain), runny nose, nosebleed.  Difficulty sleeping, drowsiness, dizziness, feeling irritated, sad, anxious, confused, memory problems, poor concentration.  Changes in kidney and liver function (monitored with blood tests).  Electrolyte changes e.g. low potassium, sodium, magnesium and calcium, and high blood sugar levels – monitored with blood tests.	side effects in your first cycle of treatment.  Severe skin reaction (Steven Johnson Syndrome Toxic Epidermal Necrolysis) causing sore red patches that blister and peel. This may follow a fever, chest infection symptoms or sensitivity of eyes to light. Seek urgent medical advice.  Side effects with anti-sickness medication include constipation, headaches, indigestion, difficulty sleeping and agitation.  Some anti-cancer medicines can damage ovaries and sperm leading to infertility/early menopause.  Some anti-cancer medicines may damage the development of a baby in the womb. It is important not to become pregnant during treatment or for 6 months after or make someone else pregnant during treatment and for 3 months after. Use effective contraception.  Complications of treatment can very occasionally be life-threatening and may result in death. The risks are different for every individual. Potentially life-threatening complications include those listed on this form, but other exceedingly rare side effects may also be life-threatening.

### Guidance for health professionals

(to be read in conjunction with the hospital's consent policy)

Patient identifier/label

#### What a consent form is for

This form documents the patient's agreement to go ahead with the treatment you have proposed. It is not a legal waiver – if patients, for example, do not receive enough information on which to base their decision, then the consent may not be valid, even though the form has been signed. Patients are also entitled to change their mind after signing the form, if they retain capacity to do so. The form should act as an aide-memoir to health professionals and patients, by providing a checklist of the kind of information patients should be offered, and by enabling the patient to have a written record of the main points discussed. In no way should the written information provided for the patient be regarded as a substitute for face-to-face discussions with the patient.

#### The law on consent

See the following publications for a comprehensive summary of the law on consent. Consent: Patients and doctors making decisions together, GMC 2020 (gmc-uk.org/guidance). Reference guide to consent for examination or treatment, Department of Health, 2nd edition 2009 (doh.gov.uk).

#### Who can give consent

Everyone aged 16 or over is presumed to have the capacity to give consent for themselves, unless the opposite is demonstrated. For young people, it is good practice to involve those with parental responsibility in the consent discussions, unless specifically asked not to. A person with parental responsibility must sign this form for a child or young person under the age of 16. Such patients should be given the opportunity to 'assent' to treatment if they wish. If a patient has the capacity to give consent but is physically unable to sign a form, you should complete this form as usual and ask an independent witness to confirm that the patient has given consent orally or non-verbally.

#### When NOT to use this form

If the patient lacks the capacity to give consent, you should use an alternative form available for this purpose (dependent on patient age). A patient lacks capacity if they have an impairment or disturbance of the brain, affecting the way their mind works. For example, if they cannot do one of the following:

- understand information about the decision to be made
- · retain that information in their mind
- use or weigh this information as a part of their decision making process, or

 communicate their decision (by talking, using sign language or any other means)

You should always take all reasonable steps (for example involving more specialist colleagues) to support a patient in making their own decision, before concluding that they are unable to do so. Relatives cannot be asked to sign a form on behalf of an adult who lacks capacity to consent for themselves, unless they have been given the authority to do so under a Lasting Power of Attorney or as a court deputy.

#### Information

Information about what the treatment will involve, its benefits and risks (including side effects and complications) and alternatives to the particular procedure proposed, is crucial for patients when making up their minds. The courts have stated that patients should be told about 'significant risks which would affect the judgement of a reasonable patient'. 'Significant' has not been legally defined, but the GMC requires doctors to tell patients about 'significant, unavoidable or frequently occurring' risks. If patients make clear they have particular concerns about certain kinds of risk, you should ensure that they are informed about these risks, even if very small or rare. You should always answer questions honestly. Sometimes, patients may make it clear that they do not want to have any information about the options, but want you to decide on their behalf. In such circumstances, you should do your best to ensure that the patient receives at least very basic information about what is proposed. Where information is refused, you should document this on the consent form or in the patient's notes.

#### **NHS Scotland**

NHS Scotland staff should refer to Healthcare Improvement Scotland. Guidance on consent for SACT and local NHS Board guidance on consent aligned to the Scottish legal framework.
