Introduction

Pollinator Scavenger Herbivore

Ecological model: moth

- High abundance and diversity •
- Host plant relations
- Well-known taxonomic group
- Effective light traps sampling ۲

Moth vertical stratification were recognized.

Lacks of seasonal variation •

Ashton et al., 2016

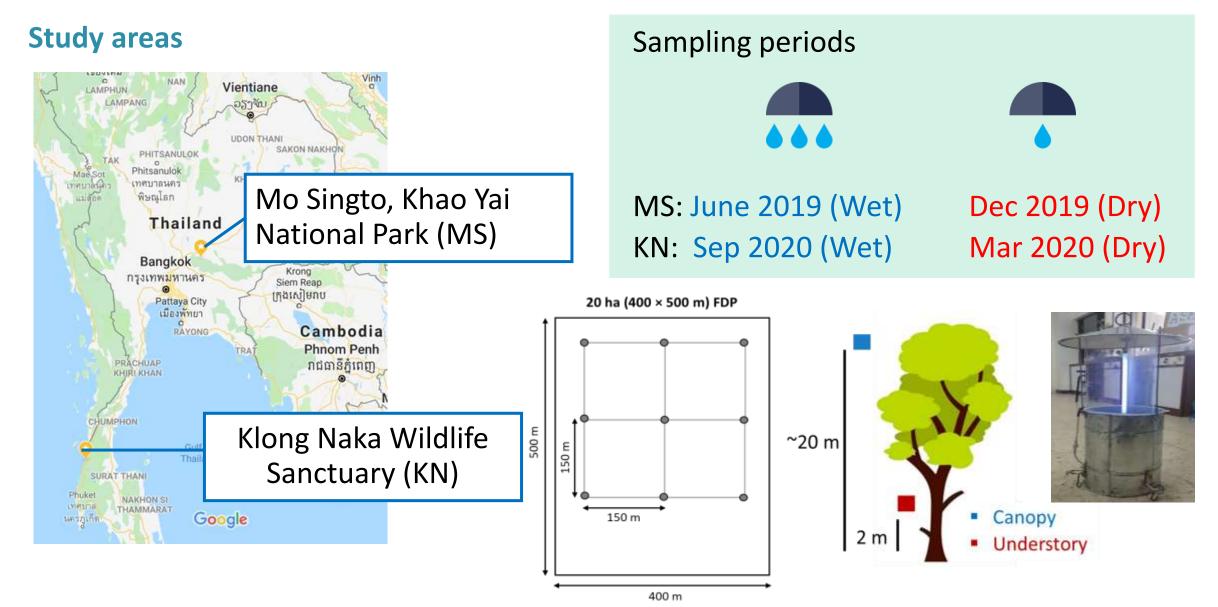

Dry season Wet season

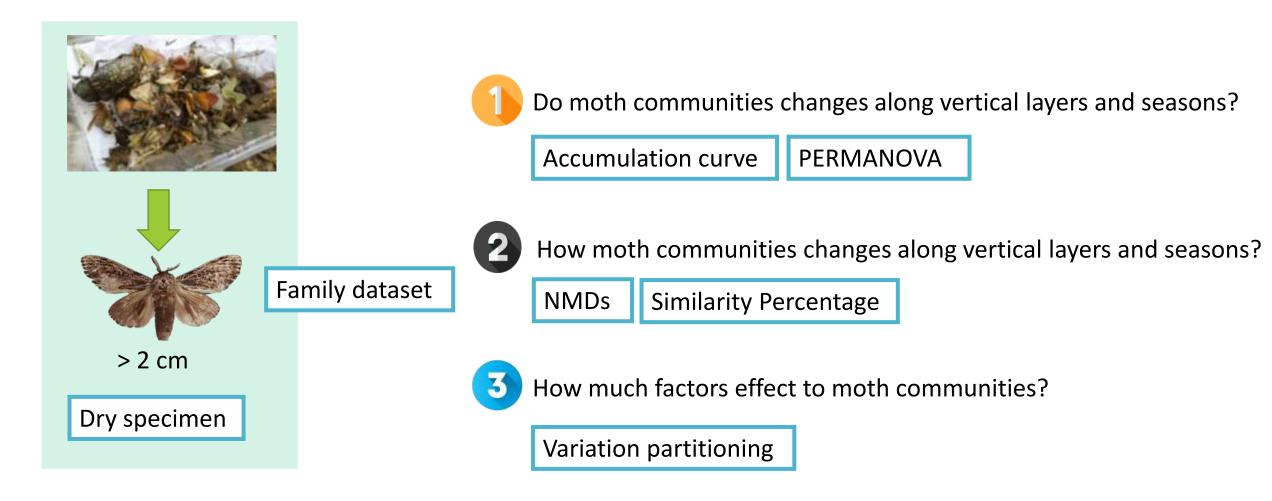

Heterogeneity Abundance Fresh leave & nectar 1. To investigate how moth communities changes along vertical dimension

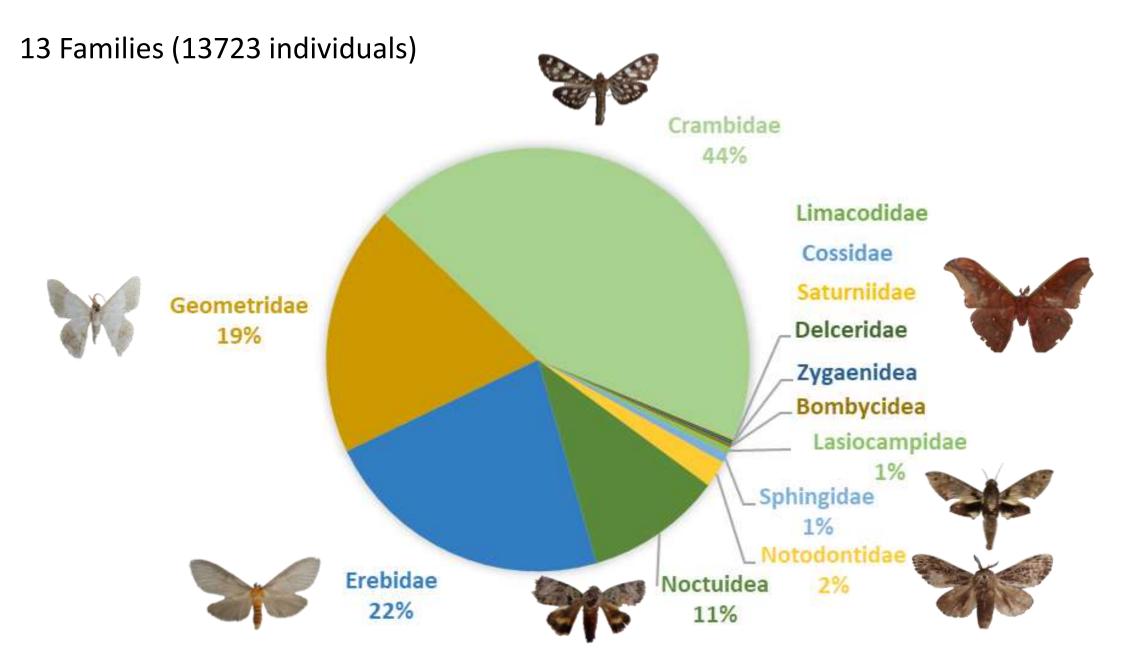

2. To observed how seasonal changes effected to vertical stratification of moth

Materials and Methods: Field sampling

Materials and Methods: Sample processing and Analysis

- Wet season increased the magnitude of vertical stratification.
- Seasonal changes are associated with weather conditions. (Grimbacher & Stork, 2009; Poulin et al., 1999).

KN had greater vertical stratification magnitude. KN had lower seasonal change influence.

Conclusion

Moth community was highly influenced by vertical stratum and seasonal changes, but the magnitude of differences depend on the forest type and latitude.

This study represented the importance of seasonal variation and vertical stratification in tropical rainforests study.
