# High Universality of *trnL-L-F* Primer Set

Family	<i>trnL-L-F</i>	<i>rbcL</i>	<i>matK</i>
Hymenophyllaceae	100.00%	100.00%	54.55%
Gleicheniaceae	100.00%	100.00%	100.00%
Plagiogyriaceae	100.00%	100.00%	50.00%
Lindsaeaceae	100.00%	50.00%	0.00%
Dennstaedtiaceae	100.00%	100.00%	80.00%
Pteridaceae	80.00%	60.00%	80.00%
Dryopteridaceae	100.00%	91.67%	16.67%
Polypodiaceae	100.00%	76.92%	7.69%
Aspleniaceae	100.00%	85.71%	14.29%
Thelypteridaceae	100.00%	22.22%	44.44%
Arthyriaceae	100.00%	90.91%	100.00%

# A new workflow adopting NGS platforms

\$\$ > Sanger's

\$\$ << Sanger's

\$\$ << Sanger's

# Sequencing Costs (incl. library)

	Miseq PE 300	PacBio sequel, SMART
Min. per run	22,000 NTD— 1.66 M reads— 1 GB (1/10lane)	92,000 NTD— 0.75 M reads <sup>b</sup> — 15 GB (one flow cell)
Max. sample per run	16667 (50X) <sup>a</sup> 8333 (100X) <sup>a</sup>	15000 (50X) <sup>b</sup>
Coverage 50X	1.32 NTD per sample	6.13 NTD per sample
Coverage 100X	2.65 NTD per sample	12.26 NTD per sample

<sup>a</sup>Separate into two amplicons within ~1kb region

<sup>b</sup>CCS reading 20 times per DNA molecular

## PRIMER DESIGN

- Selecting DNA barcode regions
- Finding conserve priming sites
- Length Evaluation
- Selecting index sequences
- Dual indexed primers

## Fern Plastome List

Here is a list of fern plastomes published in [genbank](#). You can download the csv below. The list includes complete plastomes as well as fragments greater than 10 kb. This list is based on a search using a Biopython script written by Carol Rowe and Paul Wolf, then rewritten in R by Tanner Robison Sept 2018.

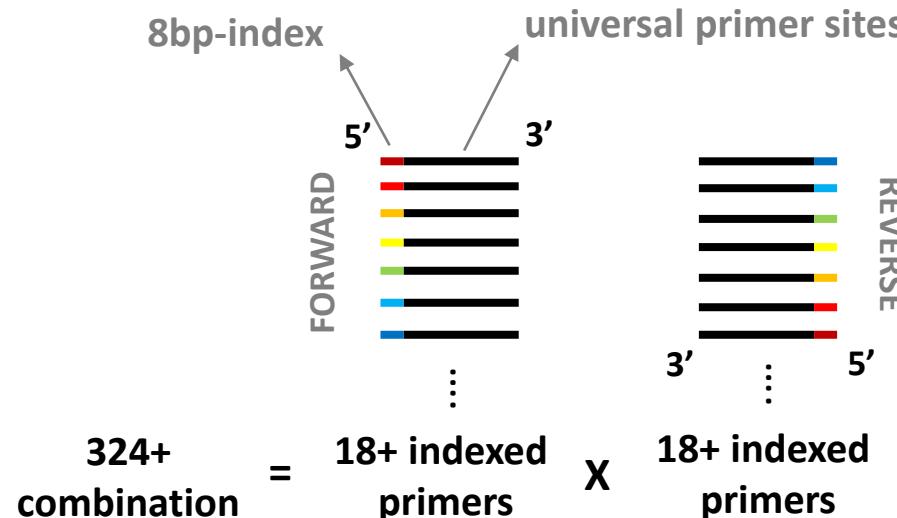

The list can be download here: [all\\_fern\\_plastomes.csv](#)

**250 plastomes (2020/9/24)**

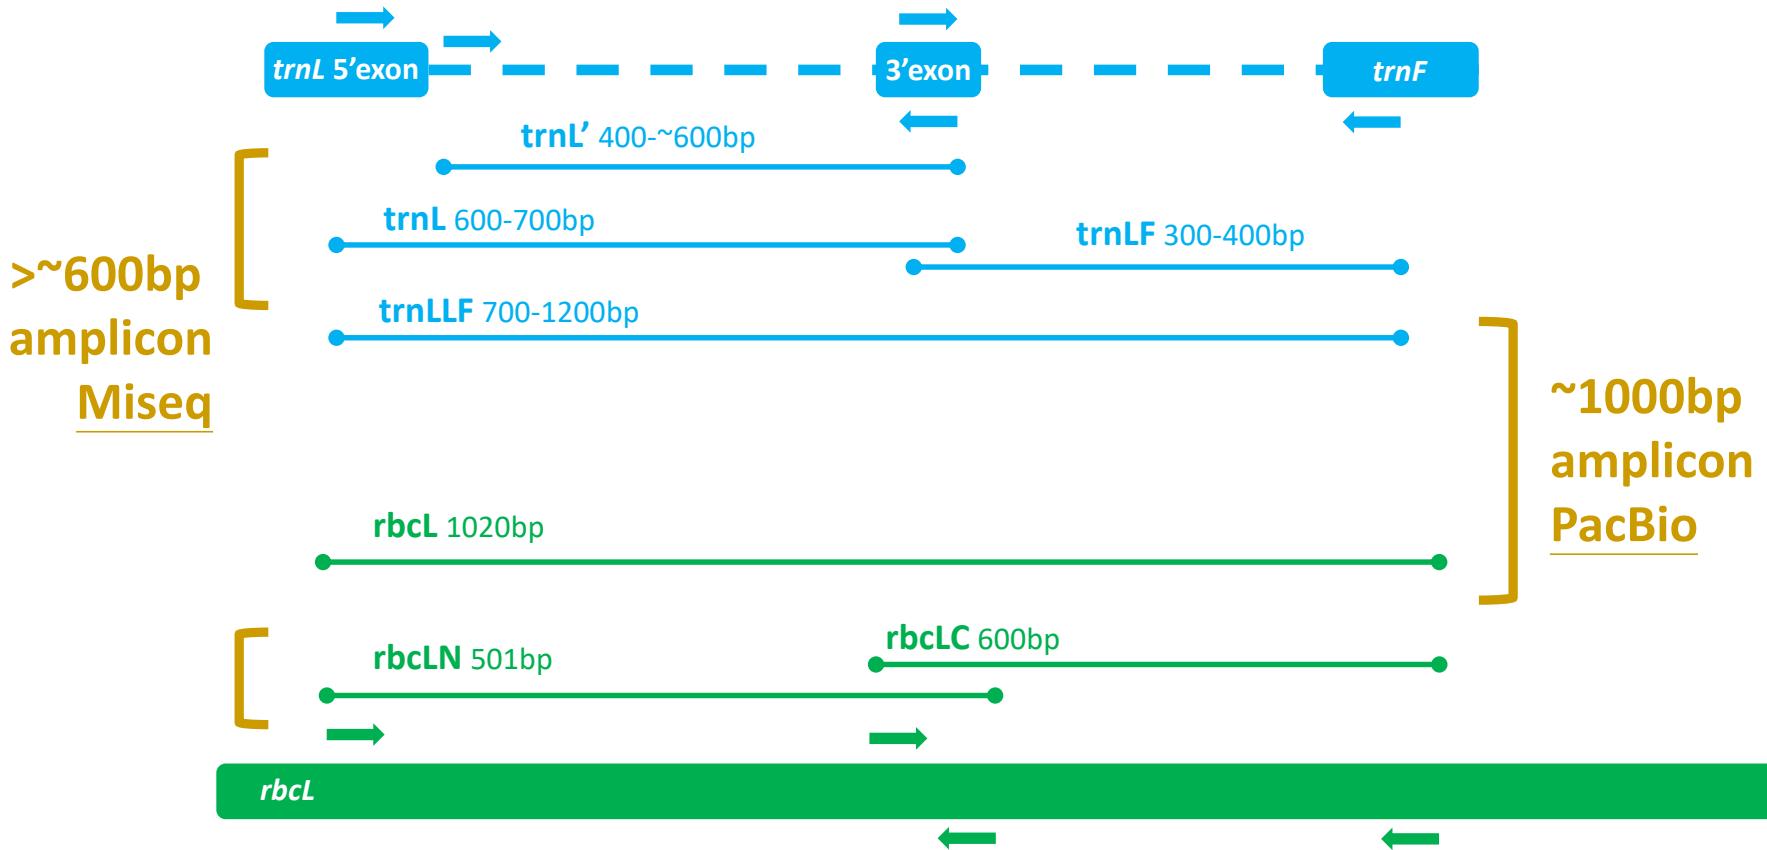

**A custom Python script finding 20-25bp conserved priming sites (Wu et al. 2022)**

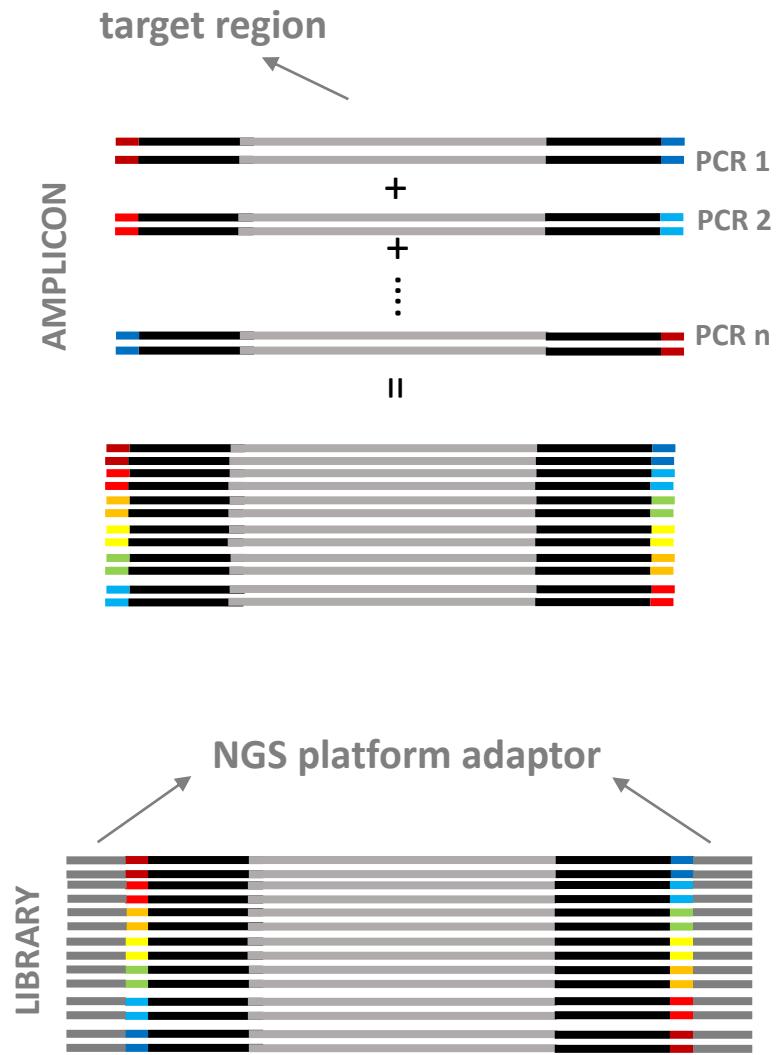

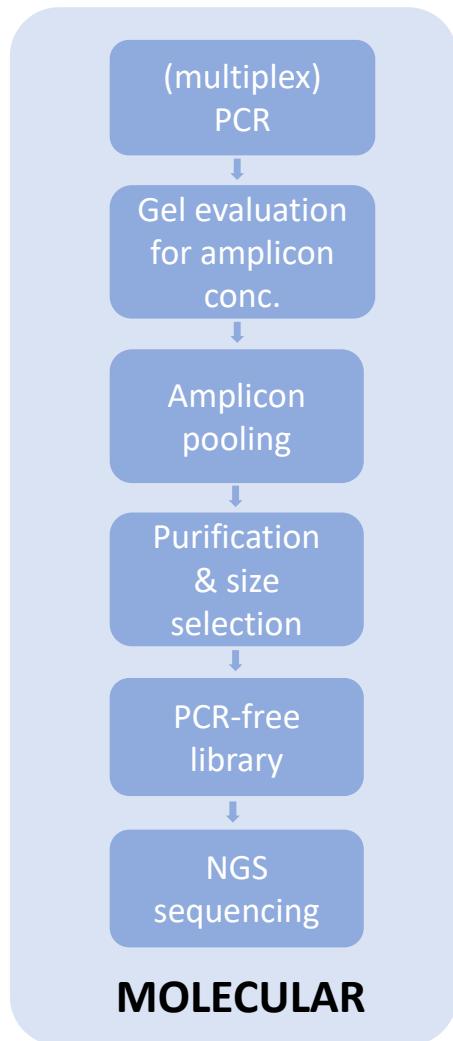

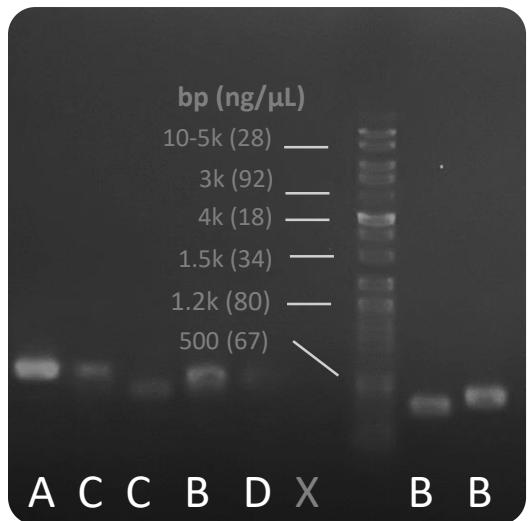

**Target region ~1,000bp or < 540bp**

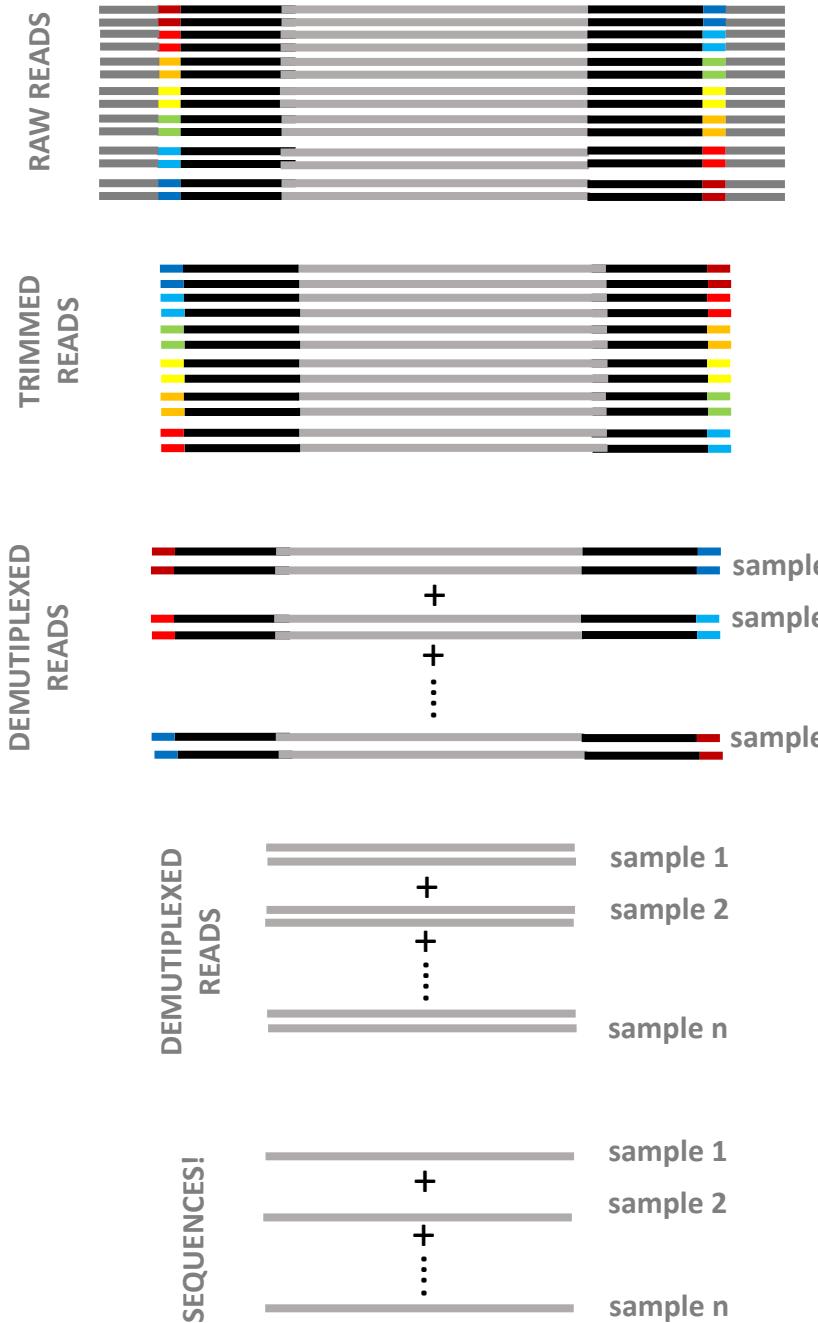

**A custom Python script evaluate mismatches of 18+ 8bp-indexes at 5' of priming sites**
