

# Sauce Mobile Beta Testing.

Streamline your mobile app beta testing with managed app distribution and user feedback collection. Easily get new app versions to your testers and collect meaningful user feedback and bug reports, for faster app iteration and release cycles.

## Sauce Mobile Beta Testing (formerly TestFairy)

helps mobile teams streamline their mobile development and beta testing processes, and provides real-time user feedback for mobile developers, enabling them to continuously release better app versions.

The platform offers a stream of capabilities including enterprise-grade app distribution, in-app bug reporting, session video recording, crash reporting, and integration to all the major bug systems, SSOs, CIs, and Team communication services. All this, in a highly secure, compliant private cloud.

## Release Better Android and iOS Apps in Shorter Development Cycles

### App Distribution

Distribute any Android and iOS app version in a highly configurable and tightly secured enterprise-grade platform. Sync with your corporate Single Sign-on to enforce corporate role-based policies so only the right people will have access to your apps.

### Video Sessions

Spend less time analyzing bug reports and quickly identify issues with session video recordings. Get real-time insights into how users use your apps on their real devices and understand everything that happened before an app crashed or a bug was reported.

### Seamless Integrations

Integrate with JIRA, Trello, Slack, or any other platform so that the issues posted by your team will automatically get filed in the right place. Sauce Labs mobile beta testing integrates seamlessly with any Issue Management System, Single Sign-on, Continuous Integration, Customer Support, and Team Communication platforms.

### In-app Bug Feedback

Uncover more issues and improve the quality of bugs reported by allowing your users to easily report meaningful bugs by simply shaking their device or just clicking on a button, with an intuitive in-app bug reporting interface.

## Security & Compliance

Comply with security standards by connecting Sauce Labs mobile beta testing to any SAML 2.0 Single Sign-On. With end-to-end encryption you can encrypt sessions with your private keys, so nobody, but your team has access to your data. As Sauce Labs mobile beta testing comes on a private cloud with a single tenant database it provides highly compliant organizations a secure environment.

## Remote Support

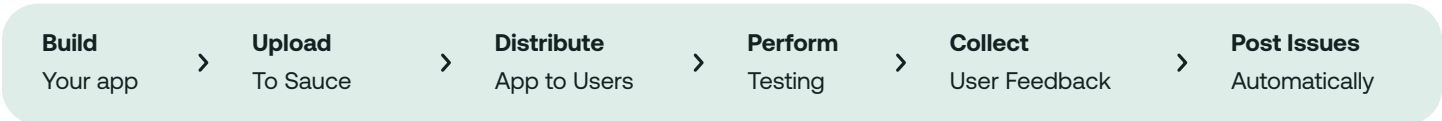

Get faster user insights to help your support teams understand how customers use their apps in production. Provide your support teams with the information they need to improve response time for customer issues and escalate support tickets to development teams in one click.

“Sauce Labs has helped us a lot in the integration process, solving any issue that has arisen in our journey.”

Eric Solà, Quality Innovation Manager at Central QA in King

## Cloud Architecture That Integrates

Simplify your mobile beta testing processes

## Easily Integrate with Any Tool in your Ecosystem
