

# CloudBees Feature Management for AWS

Enterprise feature flag management

## At a Glance

CloudBees Feature Management is the only Enterprise Feature Flag Management platform available on the AWS Marketplace, allowing Marketplace members to realize the benefits of feature flags as quickly as possible. Additionally, when you purchase and deploy an AWS Marketplace solution, customers have the potential of receiving cloud credits through the AWS Enterprise Discount Program (EDP).

## Feature Flag Usage is On the Rise

- » 81% say feature flag usage will increase over the next year
- » 37% report the cost of in-house development of a feature flag management system is higher than purchasing a solution
- » 32% say they encountered more complexity in building a feature flag management system than anticipated

As the practice becomes pervasive, the need for enterprise-level feature flag management will become an undeniably necessary addition to the DevOps toolchain.

## CloudBees Feature Management Overview

CloudBees Feature Management is an enterprise-ready feature flag management solution with robust deployment rules, audience segmentation and a testing framework for controlling which audiences are exposed to what features. With CloudBees Feature Management, you can rollout and rollback features, test and target features for specific customer segments for fast feedback and use gradual rollout and rollback capabilities to sidestep the danger of “big bang” or “big bust” deployments. CloudBees Feature Management speeds the pace of development by enabling the delivery of software changes as soon as they are code complete or even for testing a minimum viable product (MVP) within a subset of internal or external users.

## Segment Audience and Set Percentages for Gradual Rollout

## Easily manage features across teams

### Move Fast. Break Nothing.

CloudBees Feature Management allow you to separate software into discrete, controllable features. By decoupling feature deployment from code release, you can tailor customer experiences in production, in real-time, with the flip of a switch. Suddenly, the business is no longer constrained by technical backlog.

**Faster Delivery** - Gain velocity through smarter CI that embraces trunk-based development. Avoid merge conflicts associated with long-lived feature branches. Merge incomplete code in an inactive state and simply turn the feature on when it's ready for prime time. Avoid delaying releases due to late-breaking features with a higher probability of being buggy.

**Safety** - Test new code safely in both pre-production and production environments, and perform canary deployments. This can be carried out with targeted user groups, such as a subset of the user base, beta users, internal employees and other user constituencies. If a bug is discovered – even days later – don't wait for a costly rollback of the whole application or a time-consuming patch and release process, just use the killswitch to turn off that feature and then repair it.

**Experimentation** - Perform A/B testing by enabling new features only for certain customers. Analyze your metrics to make a data-driven decision about what works best.

**Customization** - Turn specific features on or off for particular customers, based on preferences, location, licensing or other criteria.

Benefits	Use Cases
<p><b>Enterprise-ready scalability and governance</b></p>	<p>Advance beyond homegrown feature management with:</p> <ul style="list-style-type: none"> <li>» Centralized dashboard for flag management across features</li> <li>» Audit logs and localized flag rules</li> <li>» Robust Security with SAML / SSO Integration</li> <li>» Zero access to end user Personally Identifiable Information (PII)</li> </ul>
<p><b>Increased Developer Productivity</b></p>	<p>Workflows:</p> <ul style="list-style-type: none"> <li>» Add flags to code first and see them on the dashboard</li> <li>» Flags-as-code: Take a "GitOps" approach to log changes to feature flags in the SCM, in the same fashion as code and configuration changes in applications</li> <li>» Set only one flag for all development languages</li> </ul>
<p><b>Shortened feature feedback loops</b></p>	<p>Gradually release features to subsets of users based on predefined criteria (country, language, version, etc.) and use your current analytics tools and teams to ensure the features will be well-received before full release</p>
