

CloudBees  
**Accelerator**  
Wait Less. Innovate More.

### THE KEYS TO INNOVATION AND QUALITY

In the industries of today, every company is a software company. Embedded systems, IoT, automotive and autotech companies find themselves competing more and more at the software level. They need to deliver innovation faster or risk missing the market. Long builds and non-value-add rework limit innovation and cause late releases.

CloudBees Accelerator helps organizations create more time for experimentation and iteration by accelerating build times and shortening QA and security testing cycles.

### HOW DOES CLOUDBEES ACCELERATOR WORK?

CloudBees Accelerator is a build and test acceleration platform for make-based, Android AOSP, Embedded Linux, BitBake, and Visual Studio build environments that intelligently and automatically parallelizes software tasks across clusters of physical or cloud CPUs to dramatically lower build and test cycle times.

### CLOUDBEES ACCELERATOR

Hours to minutes. Minutes to seconds.

#### Build Acceleration

- » Accelerates Android AOSP and Embedded Linux builds by 20x or more
- » Discovers and optimizes dependencies
- » Guarantees software build correctness
- » Eliminates redundant work through build avoidance

#### Test Acceleration

- » Improves quality by running more tests more frequently as part of CI cycle
- » Accelerates both unit test and static code analysis test cycles
- » Shifts testing left to find bugs earlier

#### Resource Optimization

- » Builds faster on less than half the infrastructure
- » Bursts to cloud during peak times
- » Eliminates surprise cloud charges from zombie build or test instances

### THE BUSINESS BENEFIT

Accelerate your development velocity by 2-3x. Save 50% or more on your infrastructure costs.

### AT A GLANCE:

- » **Fault-tolerant workload distribution** uses local, network or cloud resources.
- » **Smart load balancing** ensures optimal use of cores across the cluster.
- » **Intelligent caching** eliminates redundant work through build avoidance.
- » **Dynamic resource provisioning** provides instantaneous scale up/down.

*“Build times of many of our IVI projects were reduced by 75% resulting in an overall development velocity increase of 200%. Furthermore, the wait time for engineers submitting build requests went from one hour to 10 minutes.”*

John Penoyer  
Engineering Group Manager  
Panasonic Automotive Solutions

### Performance

Proven to speed up the world's most complex builds by as much as 20x

### Reliability

Patented technology guarantees correctness, even in the face of incomplete or incorrect dependencies

### Scalability

Intelligently manages build clouds not only across multiple teams but across multiple data centers and clouds

### Cost Elimination

Significantly reduce dedicated build hardware, greatly increase existing infrastructure utilization and easily burst to the cloud

### Insight

Visibility into single build and utilization across the organization to pinpoint problems and identify bottlenecks

| KEY FEATURES   | KEY BENEFITS   |
