

TEST FACT SHEET

Arabic (proficient/C1) Test

The Arabic (proficient/C1) test evaluates a person's knowledge of the Arabic language at the C1 level of the CEFR framework. This test will help you identify people who can participate in demanding professional and social conversations in Arabic.

Covered skills

- ✓ Vocabulary and grammar
- ✓ Sentence composition
- ✓ Reading comprehension
- ✓ Listening comprehension

Test type

Language

Available languages

English, Dutch, French, German, Spanish, Portuguese (Brazil), Japanese, Italian, Swedish, Danish, Norwegian, Polish

Administration time

10 minutes

Level

Intermediate

Number of questions

16 questions delivered to test-takers
99 questions in the question bank

Use the Arabic (proficient/C1) test to hire

Editors, writers, content creators, customer success managers, and other employees that need to be proficient in Arabic to perform well in their roles.

Scoring benchmarks

Benchmarks are available for various education levels (ranging from some high school education to Master's degree or higher), business functions (from administrative to software development), and seniority levels (junior to senior).

Psychometric properties

Each of the metrics reported below is based on a sample size (*N*) of at least 1,000 candidates, unless indicated otherwise.

Reliability Cronbach's alpha coefficient = .66

Face validity Candidates rated this test as accurately measuring their skills (average score of 4.33 out of 5.00).

Criterion-related validity Candidates with higher scores on this test received higher average ratings from the hiring team during the selection process ($r = .35, N = 105$).

Glossary

Reliability	The extent to which test scores are stable, consistent, and free from measurement error. Reliability coefficients between .6 and .69 are typically considered reasonable, values between .7 and .79 are considered acceptable, values between .8 and .89 are considered good, and values above .9 are considered great.
Validity	The accuracy of the inferences or interpretations drawn from test scores. There are several types of validity detailed below.
Face validity	The extent to which a test appears to measure what it is intended to measure, and whether, on the surface, the test feels relevant and appropriate for what it is supposed to be assessing. After completing a test, TestGorilla surveys candidates about the perceived validity and relevance of the test.
Content validity	The extent to which a test covers a representative sample of the skills and knowledge content relevant to the topic in question. TestGorilla uses a standardized test development process and formal test structures to ensure the skills and knowledge necessary for a particular topic are well-represented by the test and the test items.
Construct validity	The extent to which the test accurately measures the construct it is intended to measure.
Convergent validity	A type of construct validity. Convergent validity examines whether constructs that are supposed to be theoretically related to each other are, in fact, related. This is the opposite of discriminant validity.
Discriminant validity	A type of construct validity. Discriminant validity examines whether tests that are not supposed to be theoretically related are, in fact, unrelated. This is the opposite of convergent validity.
Criterion validity	The degree to which test scores are related to scores on an outcome measure of interest (e.g. performance ratings, turnover). Based on the newest research in the field, values of validity coefficients below .07 are typically seen as low, values between .07 and .15 are seen as moderate, values between .16 and .29 are seen as substantial, and values above .29 are considered high.
Group differences	The extent to which different groups (e.g. different age, gender, ethnic and/or racial groups) differ significantly from each other in terms of the scores obtained on a test.
