

Spirent Network Emulator

Get Predictable Infrastructure Performance with Industry's Highest Port Density

Test with Real-world Network Conditions in Your Lab

Real-life networks are a complex system of changing conditions, flexible routes and competing applications. And the only way to get predictable infrastructure performance is to test before deployment.

The Spirent Network Emulator provides industry-leading flexibility in building and modelling these complex real-life systems enabling you to simulate networks and emulate the real world conditions under which applications and platforms need to perform.

Extreme Flexibility — Multi-port and Multi-user

Spirent Network Emulator is a highly flexible solution for both network emulation and network simulation. Whether you want to emulate point-to-point links, simulate complex data-centers with multiple gateways or extract out analytical information on video systems, with the Spirent Network Emulator you can build your network in seconds.

And because every network and project requirement is different — depending on factors such as location, connectivity, quality of service, number of services and the applications being used across it — reaching beyond simple delay, jitter and bandwidth emulation is essential for any business.

Further, Network Emulator offers a multi-user, multi-port environment. Each user can be allocated a pair of ports, or a number of ports, and can password protect these ports for their own exclusive use. This ensures a very cost effective and flexible means of providing test resources to a team or department.

Spirent Network Emulator is available with multiple hardware options, including:

- Multi-port — market leading port density with up to 16 ports 1GbE, up to 12 ports 10GbE, and up to 4 ports 25GbE
- Flexible configuration—mix and match interface cards to meet your needs
- Flexible interfaces; RJ-45, SFP+ or SFP28 (or a mixture)
- Wireshark integration
- Easy automation via remote control using RESTful API
- Flow packets between any port, no limitations
- Up to 12 minutes of storage for wire-rate recording at 10Gbps
- Delay emulation up to 4 seconds at 10GbE/1GbE
- Fast visual emulation design creates networks in seconds

Key Highlights

- Multi-user
- Multi-port — best-in-class port density with up to 16 ports 1GbE, up to 12 ports 10GbE, and up to 4 ports 25GbE
- 1GbE, 10GbE and 25GbE interfaces supported
- Network simulation — using virtual routers for cloud, data-center and WAN simulation
- Connect any-port to any-port without limitations
- Delay emulation up to 30 seconds
- Over 55+ impairments and tools
- Audio and video MPEG (H.264 & H.265) modification and corruption
- Packet fragmentation and reordering
- Includes generic full packet inspection and filtering
- Packet modification; change any bits or bytes of any packet
- Load generators
- Non-volatile capture and replay
- RESTful API
- Link flapping
- Markov random packet prop
- 20M bandwidth throttle buffer for video applications

Applications

Spirent Network Emulator is a total solution to the problem of real-world Ethernet testing. It combines comprehensive and highly-accurate network emulation to enable you to:

Troubleshoot — Investigate reported problems and test resolutions without disrupting production traffic. Moreover, test specific scenarios and gain insight and data about where and when problems arise to identify effective resolutions before they become live issues.

Design Networks — Create ‘what if?’ scenarios to evaluate network changes; evaluate different topologies and technologies before expensive implementation. For example, evaluate WAN Acceleration Technology by determining how different WAN optimization products will perform under the best/average/worst conditions of your network.

Test Application Performance — Determine how your software will perform for the end user on their network before deployment; troubleshoot and resolve issues before the need for re-work, release delay or failure.

Optimize Performance — Adjust application and software settings under replicated network characteristics to optimize performance for different user groups.

Use Network Emulator to test:

- Video/voice applications (IPTV, VoIP, etc.)
- Mobile subscriber networks (VoLTE, eMBMS, etc.)
- Content delivery networks
- Cloud computing/migration
- CoS/QoS levels
- WAN acceleration/network optimization
- LAN/WAN enterprise networks
- ADSL/FTTH
- SLA verification
- ITU-T Y.1731/IEEE 802.1ag operations and maintenance
- Satellite links
- Storage networks
- Telecom/Federal network applications
- Carrier Wi-Fi
- Cable/broadband networks
- SD-WAN
- Broadcast quality video networks

Emulate Real Network Conditions

- Busy peak times
- Long distance
- Jittery connections
- Duplication of data
- Fragmentation of data
- Traffic re-routing
- Limited bandwidth
- Packet corruption
- De-sequencing of data
- Network traffic bursts
- Partial or total outage
- Back-up switchovers

Visual Design

Using Network Emulator’s unique visual design to build emulations, you take control by linking together impairments in the order you require while directly controlling the flow of packets around your simulated network.

The user interface (UI) provides a fast and responsive graphical environment for you to build emulations. The flexible UI enables you to drag and drop from the extensive list of impairments into your network to create specific scenarios to meet your testing needs.

Features

Wire Rate — The Spirent Network Emulator supports wire rate performance. All 10GbE ports are dual rate, supporting 10GbE and 1GbE operation. All 25GbE ports are multi-rate, supporting 25GbE, 10GbE and 1GbE operation. This makes the Network Emulator very flexible and can be tailored to your individual throughput needs.

“Any Port to Any Port”™ Capabilities — Network Emulator comes with true “Any Port to Any Port”™ capabilities. Whether you are using 4, 8 or 16 ports they will all communicate with each other without limitation.

Many emulate products may state you are buying a ‘4 port emulator’ but often what you actually get is two ‘emulators’ each with two ports inside a single box. There may be four ports on the outside, but the reality is that you have two independent emulators and you won’t be able to send packets between each. So effectively you have got two emulators with two ports, not the four ports you need.

Fragmentation and Reordering — When packets cross network boundaries they can become fragmented. Network Emulator can fragment packets to simulate MTU changes down to 64 bytes. Packets can also be reordered either by displacing the packets “X” number of frames or time into the future.

Automation Ready — We understand that everyone’s automation environments are different. Network Emulator can be controlled externally through a variety of methods. A RESTful API is provided offering powerful and efficient web-based automation. In addition, a Timeline (auto-change) feature allows you to easily automate emulation via the GUI. Developers can also directly issue XML requests to the emulator to gain deeper and full control of its operation.

Features (cont'd)

Load Generation — Very few networks are silent as there is always a certain amount of background traffic. Whether it is file servers, printers or other devices generating traffic, it is important to model it correctly.

Network Emulator provides a number of ways of generating this traffic including background traffic generation (contention), TCP load generators, PCAP file replay, etc.

Switchover and Back-up Circuits — Built on top of our powerful filtering system, you can easily simulate multiple paths in any network and switch between them in real-time (or using an external trigger). This allows you to model a 'good' and 'poor' network and switch between them in real time, plus you can create an unlimited number of paths.

Video and Audio — Dedicated impairments allow smart degradation of video (H.264), audio streaming, RTP, RTCP and much more. Understand how robust your AV equipment is to corruption of video or audio framing, and view analytics information on video format internals.

Impairments — Network Emulator provides all the common impairments including delay, jitter, throttle, and so on. Furthermore, it also provides advanced impairments including fragmentation, video corruption, BER corruption, reordering and many more.

Comprehensive Settings — Not only do you get 55+ impairments, but each one of those impairments has extensive options and settings to uniquely control their operation. This gives you an unparalleled level of fine tuning such as buffer and burst management on bandwidth throttles, or affecting only B-Frames in H.264 video streams.

Filtering — It's very important to be able to identify and target certain streams of data on an emulated network. Network Emulator provides a host of built-in filters to identify packets for impairment or analysis. Moreover, you can join filters together to create more complex filters (for example, you could find HTTP traffic going to Port 8080 on VLAN ID 90 with only two filters).

Flexible UI with Wizards and Easy Licensing — The Windows user interface provides a fast and responsive environment for you to build emulations. We've included some handy wizards to help you quickly create example networks and which don't lock you down to restrictive licensing (plus, install them on as many machines as you want).

Virtual Routers — Routers typically sit at the edge of most networks; they provide your ADSL connection in your business or accessibility to a cloud server through an ISP backbone.

Network Emulator contains full Virtual Router simulation, providing a method for simulating multi-hop WAN networks. These Virtual Routers provide DHCP or Static IP address assignment, automatic and manual routing table and multiple virtual interfaces. They will respond to both local and WAN pings and provide detailed analysis on packets received.

Use the Spirent Network Emulator to accurately simulate:

- SD-WAN
- Broadcast quality video networks
- VoIP
- Microwave
- Wi-Fi and WiMAX
- Satellite
- RoIP
- Cloud
- 3G and 4G
- GPRS
- Dial Up
- DSL, ADSL and XDSL

Technical Specifications	PRODUCT RANGE

Port Configuration and Performance:

1. Select the number of SNE ports required at each interface rate
2. The standard specification performance is labelled 'STD' in the configuration table below
3. The high port count specifications is labelled 'HPC' in the configuration table below.

10GbE Configuration Table

		10GbE/1GbE Optical Ports (SFP+)							
		No. of Ports	0	2	4	6	8	10	12
1GbE Electrical Ports (RJ45)	0			STD	STD	STD	STD	HPC	HPC
	2	STD	STD	STD	STD	STD	HPC	HPC	HPC
	4	STD	STD	STD	STD	STD	HPC	HPC	HPC
	6	STD	STD	STD	STD	HPC	HPC		
	8	STD	STD	STD	STD	HPC	HPC		
	10	STD	STD	HPC					
	12	STD	STD	HPC					
	14	STD							
	16	STD							

25GbE (2 Ports) Configuration Table

		2 ports of 25GbE SFP28 and see line below for number of 10GbE SFP+ Optical Ports				
		No. of Ports	0	2	4	6
1GbE Electrical Ports (RJ45)	0			STD	STD	STD
	2	STD	STD	STD		
	4	STD	STD	STD		
	6	STD	STD			
	8	STD	STD			
	10	STD				
	12	STD				

25GbE (4 Ports) Configuration Table

4 ports of 25GbE SFP28 and see line below for number of 10GbE SFP+ Optical Ports				
	No. of Ports	0	2	4
1GbE Electrical Ports (RJ45)	0		STD	STD
	2	STD	STD	
	4	STD	STD	
	6	STD		
	8	STD		

- STD** Combination of 2-port 10G modules and 4-port 1G modules – “Standard” performance specification
- HPC** Combination of 4-port 10G modules and 4-port 1G modules – “High Port Count” performance specification

STD (10GbE/1GbE Standard Specification)

- Wire Rate with 128 byte traffic on all ports (up to eight 10GbE ports)
- Wire Rate with 64 byte traffic on any four 10GbE ports or all 1GbE ports

HPC (10GbE/1GbE High Port Count Performance)

- Wire Rate with iMix traffic on all ports (up to twelve 10GbE ports)
- Wire Rate with 64 byte traffic on any two 10GbE ports or all 1GbE ports

25GbE Specification

- 90% Wire Rate with iMix traffic on all 25GbE ports (up to four 25GbE ports)
- 97% Wire Rate with 512 byte traffic on all 25GbE ports (up to four 25GbE ports)

NOTE: DOES NOT INCLUDE mixing 4 port 10G modules and 2 port 10G modules – NOT CURRENTLY PERMITTED

About Spirent Communications

Spirent Communications (LSE: SPT) is a global leader with deep expertise and decades of experience in testing, assurance, analytics and security, serving developers, service providers, and enterprise networks. We help bring clarity to increasingly complex technological and business challenges. Spirent’s customers have made a promise to their customers to deliver superior performance. Spirent assures that those promises are fulfilled. For more information visit: www.spirent.com
