

MIGRATION MAP

SERENGETI, TANZANIA

The annual migration is the movement of vast numbers of wildebeest, accompanied by large numbers of zebra and smaller numbers of Thomson's gazelle, eland and impala. They migrate throughout the year, constantly seeking fresh grazing. The precise timing of the Serengeti wildebeest migration is entirely dependent upon the rainfall patterns each year and can be very unpredictable.

The below is strictly a guideline and may differ from year to year.

January-March

The herds are usually calving in the southern Serengeti plains where the grass growth is most productive and the nutrient contents high.

April-May

The herds start moving north towards the central Serengeti plains.

June-July

The herds move northwest towards Singita Grumeti.

August-September

Herds continue north towards the Maasai Mara and can be seen at Singita Mara River Tented Camp in Lamai. The herds must cross the Mara River before they reach Kenya's Maasai Mara. The animals then continue to move backwards and forwards across the Mara River as they continue into the Maasai Mara.

October-November

Following the rainfalls, the migration continues north into the Maasai Mara.

December

The migration starts moving south again, back into the Serengeti following the rains. The herds may return to Singita Grumeti as they make their way south.

Due to the successful work of the Grumeti Fund, game viewing at Singita Grumeti is excellent throughout the year with an abundance and variety of residential game.
