

Perfect Delivery. Optimal Performance. Easy Removal.

UltraCal™ XS Paste and Ultradent™ Citric Acid 20% Solution

UltraCal XS calcium hydroxide paste (pH 12.5) is easily delivered with the NaviTip™ tip exactly where it is needed in the canal. Its aqueous consistency and radiopaque properties make it ideal as an endodontic treatment dressing for two-appointment RCTs.

When it comes time to remove UltraCal XS paste from the canal, look no further than **Ultradent Citric Acid Solution**, delivered with the NaviTip™ FX™ tip. Citric Acid solution dissolves calcium hydroxide, and the small fibers attached to the NaviTip FX tip easily scrub the walls of the canal, removing any remaining calcium hydroxide as well as the smear layer.
