

Your architecture. Untouched.

Recurly Recover integrates with your existing billing system through a focused API and webhook workflow. Submit eligible past-due invoices, pause parallel internal retries, and let Recover manage the retry lifecycle while keeping your system updated on every outcome.

WHY IT MATTERS TO YOU

API-only, zero migration

Keep your current billing platform and add a standalone recovery engine alongside it.

Clear control boundaries

Recover executes payment attempts while your system receives the results and determines downstream actions.

A focused integration

Connect your gateway, configure retry windows, submit eligible invoices, and process lifecycle webhooks.

Systems that stay synchronized

Stop future retries when an invoice status changes and keep recovery activity aligned across platforms.

Recovery in action

“As our business has grown and the volume has increased, our relationship with Recurly has only strengthened.”

— President, monthly clothing rental subscription service

No migration required

This is a single API endpoint and webhooks, not a migration. Your billing system stays exactly as it is, and you remain a merchant of record — with zero double-charge risk and no disruption to the architecture your team already built.

Retain more without disruption
