

Embed Process Intelligence
into your everyday operations
for maximum ROI

Process Intelligence API

Turn context into action

Deliver real-time, contextual insights from Celonis into every system that needs them

Scale the Celonis effect

Extend the reach of Process Intelligence across your systems and tools, fueling innovation across more roles and functions

Maximize tech investments

Supercharge the ROI of existing AI and automation platforms by giving them the input they need to drive results

More and more businesses are investing in best-of-breed SaaS applications, automation tools, and AI agents to improve business outcomes. But too often, these technologies operate in silos and lack critical context about business processes. This limits their use cases, adoption, and overall return on investment.

The Celonis Process Intelligence API is a developer-friendly interface that programmatically brings Process Intelligence into these investments to supercharge them with real-time context. **The result? Smarter, more connected systems and measurable impact.**

A European food and beverage company used the Celonis Process Intelligence API to connect its systems and speed up the removal of credit blocks on sales orders. The API powered the ‘Process Collaboration Agent’, a third-party agent built by Rollio, which used Celonis’ unique data and business context to take action faster and more intelligently.

The Process Collaboration Agent will let us be smarter and faster in managing process exceptions, said the company’s automation director. How? By enabling teams to quickly and consistently access information that they would otherwise have to search for across different systems in a complex, time-consuming manner, added the director.

Join the 1,350+ companies who are already using Celonis to make their processes and AI work.
