

Professional Service: Custom Emission Factors

This service involves a collaborative effort between both Parties to manually integrate customer-specific CO₂ emission factors as an alternative to the standard emission factors provided by BuildingMinds. This integration will enable users to simulate key performance indicators (KPIs) using either the BuildingMinds platform's standard factors or the imported customer-specific factors.

Planned outcomes:

1. Successful integrations of customer-specific CO₂ emission factors into the platform.
2. Users have the ability to select and view dashboards based on calculations using either BuildingMinds' standard CO₂ emission factors or the imported customer-specific factors.

Customer's responsibilities and dependencies:

1. Provide customer-specific CO₂ emission factors for each resource type and sub-type or identify an official source for obtaining these factors.
2. Grant BuildingMinds cost-free access to any required license rights for the use of customer-specific CO₂ emission factors, if applicable.
3. Perform manual tests on the BuildingMinds platform after the successful import of customer-specific CO₂ emission factors to ensure accurate integration and functionality.
