## Professional Service: System Integration Setup

This Professional Service involves the integration of external systems or services with the BuildingMinds Platform through the use of APIs. This enables the seamless transfer of master data and utility consumption data related to the Customer's buildings. The integration process includes the development of a comprehensive data mapping plan that aligns the source system or service with the data structure of the BuildingMinds Platform.

**Planned outcomes:**

1. Establishment of a secure connection between the external system or service and the BuildingMinds Platform.
2. Creation and implementation of a detailed mapping plan that aligns the data objects of the external system or service with the objects utilized within the BuildingMinds Platform.
3. Execution of unidirectional data transfer from the external system or service to the BuildingMinds Platform, adhering to the predefined data flow, granularity, update intervals, and system constraints.

**Customer collaboration and dependencies:**

1. Designation of a single point of contact from the Customer with appropriate access rights to the external system or service.
2. Provision of necessary API access, integration rights, and any required license rights by the Customer for the cost-free utilization of the API and data by BuildingMinds.
3. Assistance from the Customer in defining or establishing a logical mapping plan that aligns the objects used by the external system or service with the objects employed within the BuildingMinds Platform.
4. Customer's commitment to conducting integration and user testing as needed.
